

**UPPER  
BOUNDING  
TECHNIQUE**

This Hypercard stack was prepared by:  
Dennis L. Bricker,  
Dept. of Industrial Engineering,  
University of Iowa,  
Iowa City, Iowa 52242  
e-mail: dbricker@icaen.uiowa.edu

**Upper Bounding Technique**

Consider the LP:

$$\begin{aligned} \text{Max } & 2x_1 + 4x_2 + 5x_3 + 3x_4 \\ \text{subject to } & x_1 + 3x_2 + 6x_3 + 2x_4 \leq 24 \\ & 5x_1 + 4x_2 + 4x_4 \leq 20 \\ \text{Simple upper bounds } & \begin{cases} 0 \leq x_1 \leq 3 \\ 0 \leq x_2 \leq 4 \\ 0 \leq x_3 \leq 3 \\ 0 \leq x_4 \leq 3 \end{cases} \end{aligned}$$

©Dennis Bricker, U. of Iowa, 1998

If the upper bounding technique (UBT) is NOT used, the tableau is

|   |   |   |   |   |   |   |   |   |   |    |
|---|---|---|---|---|---|---|---|---|---|----|
| 2 | 4 | 5 | 3 | 0 | 0 | 0 | 0 | 0 | 0 | 0  |
| 1 | 3 | 6 | 2 | 1 | 0 | 0 | 0 | 0 | 0 | 24 |
| 5 | 4 | 0 | 4 | 0 | 1 | 0 | 0 | 0 | 0 | 20 |
| 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 3  |
| 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 4  |
| 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 3  |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 3  |

and a 6x6 basis inverse matrix must be maintained.

When using UBT, only a 2x2 "working basis" is used.

©Dennis Bricker, U. of Iowa, 1998

When using the Upper Bounding Technique,

- **nonbasic variable** may be at *either*
  - lower bound
  - or
  - upper bound
- a variable **enters the basis** by
  - increasing if it is at its lower bound
  - or
  - decreasing if it is at its upper bound

©Dennis Bricker, U. of Iowa, 1998

When using the Upper Bounding Technique,

- choice of the **pivot column** :
  - reduced cost  $\begin{cases} <0 & \text{if at lower bound} \\ >0 & \text{if at upper bound} \end{cases}$  *for minimization problem*
  - relative profit  $\begin{cases} >0 & \text{if at lower bound} \\ <0 & \text{if at upper bound} \end{cases}$  *for maximization problem*

©Dennis Bricker, U. of Iowa, 1998

When using the Upper Bounding Technique,

- Choice of the **pivot row** :
  - The variable entering the basis from one bound (either lower or upper) is "blocked" whenever it reaches its other bound
  - or a variable currently in the basis reaches its lower bound
  - or a variable currently in the basis reaches its upper bound

©Dennis Bricker, U. of Iowa, 1998

**Upper  
Bounding  
Technique**

Consider the LP

$$\begin{aligned} \text{Maximize } & cx \\ \text{subject to } & Ax = b \\ & L_i \leq x_i \leq U_i \end{aligned}$$

$L_i$  might be, but need not be, zero !

Define a basis ("working basis") B such that

$$(A^B)^{-1} \text{ exists, i.e., } \det(A^B) \neq 0$$

and partition the non-basic variables into subsets

$$L = \{i \mid x_i = L_i\} \quad \text{and} \quad U = \{i \mid x_i = U_i\}$$

©Dennis Bricker, U. of Iowa, 1998

$$\begin{aligned} A^B x_B + A^L x_L + A^U x_U &= b \\ A^B x_B &= b - A^L x_L - A^U x_U \\ x_B &= (A^B)^{-1} b - (A^B)^{-1} A^L x_L - (A^B)^{-1} A^U x_U \end{aligned}$$

The current basic solution is

$$\begin{aligned} \text{non-basic variables } & \begin{cases} x_U = U_U \\ x_L = L_L \end{cases} \\ \text{basic variables } & x_B = (A^B)^{-1} b - (A^B)^{-1} A^L x_L - (A^B)^{-1} A^U U_U \end{aligned}$$

©Dennis Bricker, U. of Iowa, 1998

**Selection of Variable to Enter Basis**

A nonbasic variable may be in either set L (at lower bound) or set U (at upper bound)

The "relative profit" ("reduced cost" if minimizing) specifies the change in the objective function per unit *increase* in the nonbasic variable.

| Non basic set | Change in $x_j$ if entering basis | sign of $\bar{c}_j = c_j - \pi A^j$ | change in objective |
|---------------|-----------------------------------|-------------------------------------|---------------------|
| U             | decrease                          | positive                            | decrease            |
|               |                                   | negative                            | increase            |
| L             | increase                          | positive                            | increase            |
|               |                                   | negative                            | decrease            |

**Selection of Variable to Enter Basis**

Suppose that a nonbasic variable  $x_j$  were to be selected to enter the basis...

©Dennis Bricker, U. of Iowa, 1998

©Dennis Bricker, U. of Iowa, 1998

| Nonbasic Variable  | Substitution Rate in Row $i$ $\alpha_{ij}$ | Effect on Basic Variable $X_k$ in Row $i$ | Blocking Value              |
|--------------------|--|---|-----------------------------|
| in L<br>INCREASING | positive                                   | decrease                                  | $(X_k - L_k)/\alpha_{ij}$   |
|                    | negative                                   | increase                                  | $(U_k - X_k)/ \alpha_{ij} $ |
| in U<br>DECREASING | positive                                   | increase                                  | $(U_k - X_k)/ \alpha_{ij} $ |
|                    | negative                                   | decrease                                  | $(X_k - L_k)/\alpha_{ij}$   |

When the nonbasic variable  $X_j$  is increasing from its LOWER BOUND:

The bound on the increase is  $\theta$ , where:

$$\theta = \begin{cases} \theta_0 = U_j - L_j \\ \theta_1 = \text{minimum}_{\alpha_{ij} > 0} \left\{ \frac{X_k - L_k}{\alpha_{ij}} \right\} \\ \theta_2 = \text{minimum}_{\alpha_{ij} < 0} \left\{ \frac{U_k - X_k}{|\alpha_{ij}|} \right\} \\ \theta = \text{minimum} \{ \theta_0, \theta_1, \theta_2 \} \end{cases}$$

**Selection of Pivot Row**

If "blocking value" is greater than  $U_j - L_j$ , then the nonbasic variable is moved from L to U (or vice-versa), but the basis B is unchanged!

**Selection of Pivot Row**

©Dennis Bricker, U. of Iowa, 1998

©Dennis Bricker, U. of Iowa, 1998

$\theta = \text{minimum} \{ \theta_0, \theta_1, \theta_2 \}$

| $\theta$   | blocking value                         | change in partition:               |
|------------|--|------------------------------------|
| $\theta_0$ | $U_j - L_j$                            | j transfers from L to U            |
| $\theta_1$ | $\frac{X_k - L_k}{\alpha_{ij} (>0)}$   | j enters B<br>k leaves B, enters L |
| $\theta_2$ | $\frac{U_k - X_k}{ \alpha_{ij}  (<0)}$ | j enters B<br>k leaves B, enters U |

When the nonbasic variable is decreasing from its UPPER BOUND:

The bound on the decrease is  $\theta$ , where:

$$\theta = \begin{cases} \theta_0 = U_j - L_j \\ \theta_1 = \text{minimum}_{\alpha_{ij} > 0} \left\{ \frac{U_k - X_k}{\alpha_{ij}} \right\} \\ \theta_2 = \text{minimum}_{\alpha_{ij} < 0} \left\{ \frac{X_k - L_k}{|\alpha_{ij}|} \right\} \\ \theta = \text{minimum} \{ \theta_0, \theta_1, \theta_2 \} \end{cases}$$

**Selection of Pivot Row**

When the nonbasic variable  $X_j$  is increasing from its LOWER BOUND

**Selection of Pivot Row**

©Dennis Bricker, U. of Iowa, 1998

©Dennis Bricker, U. of Iowa, 1998

$\theta = \text{minimum} \{ \theta_0, \theta_1, \theta_2 \}$

| $\theta$   | blocking value                         | change in partition:                   |
|------------|--|--|
| $\theta_0$ | $U_j - L_j$                            | j transfers from L to U<br>B unchanged |
| $\theta_1$ | $\frac{U_k - X_k}{\alpha_{ij} (>0)}$   | j enters B<br>k leaves B, enters U     |
| $\theta_2$ | $\frac{X_k - L_k}{ \alpha_{ij}  (<0)}$ | j enters B<br>k leaves B, enters L     |

When the nonbasic variable is decreasing from its UPPER BOUND

**Selection of Pivot Row**

Examples, with output from APL workspace UBT

 Minimize  $18X_1 + 25X_2$   
subject to  $\begin{cases} 30 \leq 5X_1 + 4X_2 \leq 55 \\ -12 \leq 4X_1 - 3X_2 \leq 4 \\ 2 \leq X_1 \leq 5, 4 \leq X_2 \leq 8 \end{cases}$

 Max  $2x_1 + 4x_2 + 5x_3 + 3x_4$   
subject to  $\begin{cases} x_1 + 3x_2 + 6x_3 + 2x_4 \leq 24 \\ 5x_1 + 4x_2 + 4x_4 \leq 20 \\ x_1 \leq 3, x_2 \leq 4, x_3 \leq 3, x_4 \leq 3 \\ x_j \geq 0 \quad \forall j \end{cases}$

©Dennis Bricker, U. of Iowa, 1998

**Example**

Minimize  $18X_1 + 25X_2$   
 subject to

$$\begin{cases} 30 \leq 5X_1 + 4X_2 \leq 55 \\ -12 \leq 4X_1 - 3X_2 \leq 4 \\ 2 \leq X_1 \leq 5, 4 \leq X_2 \leq 8 \end{cases}$$

The ordinary simplex or revised simplex method would require a tableau with 8 constraints, and 8 slack &/or surplus variables (in addition to  $X_1$  and  $X_2$ ). That is, an 8x8 basis matrix is required.

©Dennis Bricker, U. of Iowa, 1998

©Dennis Bricker, U. of Iowa, 1998

Add slack variables to the  $\leq$  constraints to create equalities. Then put upper bounds on these slack variables:

Maximize  $18X_1 + 25X_2 + 0X_3 + 0X_4$   
 subject to

$$\begin{cases} 5X_1 + 4X_2 + X_3 = 55 \\ 4X_1 - 3X_2 + X_4 = 4 \end{cases}$$

upper & lower bounds

$$\begin{cases} 2 \leq X_1 \leq 5 \\ 4 \leq X_2 \leq 8 \\ 0 \leq X_3 \leq 25 \\ 0 \leq X_4 \leq 16 \end{cases}$$

Using UBT, only a 2x2 basis matrix is required, i.e. a reduction of nearly 94% in the number of elements in the inverse matrix!

|   |    |   |   |    |
|---|----|---|---|----|
| 1 | 2  | 3 | 4 | b  |
| 5 | 4  | 1 | 0 | 55 |
| 4 | -3 | 0 | 1 | 4  |

Constraints

|      |    |    |    |    |
|------|----|----|----|----|
| i    | 1  | 2  | 3  | 4  |
| c[i] | 18 | 25 | 0  | 0  |
| L[i] | 2  | 4  | 0  | 0  |
| U[i] | 5  | 8  | 25 | 16 |

Objective & Bounds

Current partition:  
 B = 2 4 / L = 3 / U = 1

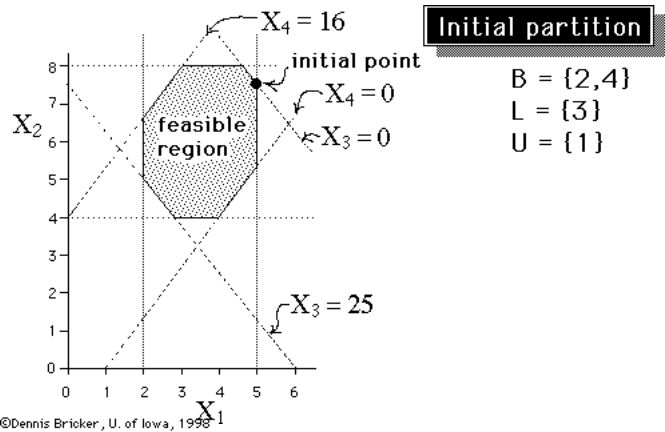

Basis inverse matrix =  $\begin{bmatrix} 0.25 & 0 \\ 0.75 & 1 \end{bmatrix}$

|                  |             |                    |             |                    |                |
|------------------|-------------|--------------------|-------------|--------------------|----------------|
| Basic solution = | $X_1$       | $X_2$              | $X_3$       | $X_4$              |                |
|                  | 5           | 7.5                | 0           | 6.5                | with Z = 277.5 |
|                  | =           | =                  | =           | =                  |                |
|                  | upper bound | intermediate value | lower bound | intermediate value |                |

Iteration 1

|           |
|-----------|
| B = {2,4} |
| L = {3}   |
| U = {1}   |

©Dennis Bricker, U. of Iowa, 1998

Initial partition

|           |
|-----------|
| B = {2,4} |
| L = {3}   |
| U = {1}   |

©Dennis Bricker, U. of Iowa, 1998

Simplex multipliers =  $\pi = C_B(A^B)^{-1} = [25, 0]$

Reduced costs =  $C - \pi A = [18, 25, 0, 0] - [25/4, 0] \begin{bmatrix} 5 & 4 & 1 & 0 \\ 4 & -3 & 0 & 1 \end{bmatrix}$

Since we wish to minimize, we would choose to increase either  $X_1$  or  $X_3$ ... however,  $X_1$  is already at its upper bound ( $U=\{1\}$ ) and so we choose to enter  $X_3$  into the basis.

©Dennis Bricker, U. of Iowa, 1998

Entering variable is  $X_3$  from set L  
 Substitution Rates = 0.25 0.75

The substitution rates indicate that for each unit increase by  $X_3$ , the first basic variable ( $X_2$ ) will be reduced by 0.25 and the second ( $X_4$ ) will be reduced by 0.75.

$X_2$  is currently 7.5, and its lower bound is 4, so that it must leave the basis when it is decreased by 3.5, i.e., when  $X_3$  is increased by  $\frac{7.5 - 4}{0.25} = 14$

Likewise,  $X_4$  can decrease by only 6.5 before it must leave the basis, i.e.,  $X_3$  can increase by only  $\frac{6.5 - 0}{0.75} = 26/3$

©Dennis Bricker, U. of Iowa, 1998

Entering variable is  $X_3$  from set L

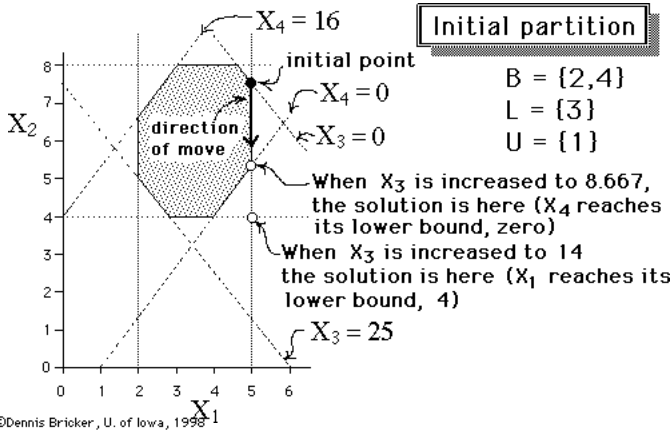

Substitution Rates= 0.25 0.75

The substitution rates indicate that for each unit increase by  $X_3$ , the first basic variable ( $X_2$ ) will be reduced by 0.25 and the second ( $X_4$ ) will be reduced by 0.75.

Decreasing variables:  
Block at value:  $\frac{7.5 - 4}{0.25}$   $\frac{6.5 - 0}{0.75}$

Block at  $X_4$  at value 8.66667

the minimum ratio!

Current partition:  
 $B = 2, 3 / L = 4 / U = 1$   
 Basis inverse matrix =  $\begin{bmatrix} 0 & -0.33333 \\ 1 & 1.33333 \end{bmatrix}$   
 $B = \{2, 3\}$ ,  
 $L = \{4\}$ ,  $U = \{1\}$

Basic solution= 5 5.33333 8.66667 0 with  $Z = 223.333$   
 Simplex multipliers= 0 -8.33333  
 Reduced costs= 51.33333 0 0 8.33333

Since we are minimizing, we would choose to decrease either  $X_1$  or  $X_4$ . However,  $X_4$  is already at its lower bound, and so we choose to enter  $X_1$  into the basis (from set U).

Entering variable is  $X_1$  from set U  
 Substitution Rates= -1.33333 10.3333

The negative substitution rate indicates that the first basic variable ( $X_2$ ) will also decrease as  $X_1$  is decreased, while the positive substitution rate indicates that the second basic variable ( $X_3$ ) will increase as  $X_1$  is decreased.

Increasing variables:  
Block at value: 1.581  $\frac{U_3 - x_3}{\alpha_2} = \frac{25 - 8 \frac{2}{3}}{10 \frac{1}{3}}$   
 Decreasing variables:  
Block at value: 1.000  $\frac{x_2 - L_2}{\alpha_1} = \frac{5 \frac{1}{3} - 4}{\frac{4}{3}}$   
 Block at  $X_2$  at value 1

Relative profits= 1.16667 1.5 0 1.33333 -0.833333 0

Entering variable is X[4] from set L  $\theta_0 = 3 - 0$

Substitution Rates= 0.333333 4

Decreasing variables:  $\begin{matrix} & 3 & 6 \\ \text{Block at value:} & 6.000 & 1.000 \end{matrix}$

Block at X[6] at value 1  $\theta_2 = \infty$   $\theta_1$

*Variable 6 is replaced in B by variable 4, and enters set L*

©Dennis Bricker, U. of Iowa, 1998

Current partition:  
 B= 3 4 / L= 1 5 6 / U= 2 Iteration 5

Basis inverse matrix =  $\begin{bmatrix} 0.166667 & -0.0833333 \\ 0 & 0.25 \end{bmatrix}$

Basic solution= 0 4 1.66667 1 0 0 with Z = 27.3333

Simplex multipliers= 0.833333 0.333333

Relative profits= -0.5 0.166667 0 0 -0.833333 -0.333333

variable 1 is in L and cannot be decreased variable 2 is in U and cannot be increased

variable 6 is in L and cannot be decreased variable 5 is in L and cannot be decreased

©Dennis Bricker, U. of Iowa, 1998

Optimal partition: B = { 3, 4 }, L = { 1, 5, 6 }, U = { 2 }

Optimal Solution
