

9.15

9.15 Air enters a square duct through a 1-ft opening as is shown in Fig. P9.15. Because the boundary layer displacement thickness increases in the direction of flow, it is necessary to increase the cross-sectional size of the duct if a constant  $U = 2 \text{ ft/s}$  velocity is to be maintained outside the boundary layer. Plot a graph of the duct size,  $d$ , as a function of  $x$  for  $0 \leq x \leq 10 \text{ ft}$  if  $U$  is to remain constant. Assume laminar flow.

FIGURE P9.15

For incompressible flow  $Q_0 = Q(x)$  where  $Q_0 = \text{flowrate into the duct}$   
 and  $= UA_0 = (2 \frac{\text{ft}}{\text{s}})(1 \text{ft}^2) = 2 \frac{\text{ft}^3}{\text{s}}$

$Q(x) = UA$ , where  $A = (d - 2\delta^*)^2$  is the effective area of the duct (allowing for the decreased flowrate in the boundary layer).

Thus,

$$Q_0 = U(d - 2\delta^*)^2 \quad \text{or} \quad d = 1 \text{ft} + 2\delta^* \quad (1)$$

where

$$\delta^* = 1.721 \sqrt{\frac{\nu x}{U}} = 1.721 \left[ \frac{(1.57 \times 10^{-4} \frac{\text{ft}^2}{\text{s}}) x}{2 \frac{\text{ft}}{\text{s}}} \right]^{\frac{1}{2}} = 0.0152 \sqrt{x} \text{ ft, where } x \sim \text{ft}$$

Hence, from Eq. (1)

$$d = \underline{1 + 0.0304 \sqrt{x} \text{ ft}}$$

For example,  $d = 1 \text{ ft}$  at  $x = 0$  and  $d = 1.096 \text{ ft}$  at  $x = 10 \text{ ft}$ .
