

2.89

2.89 The concrete (specific weight = 150 lb/ft³) seawall of Fig. P2.89 has a curved surface and restrains seawater at a depth of 24 ft. The trace of the surface is a parabola as illustrated. Determine the moment of the fluid force (per unit length) with respect to an axis through the toe (point A).

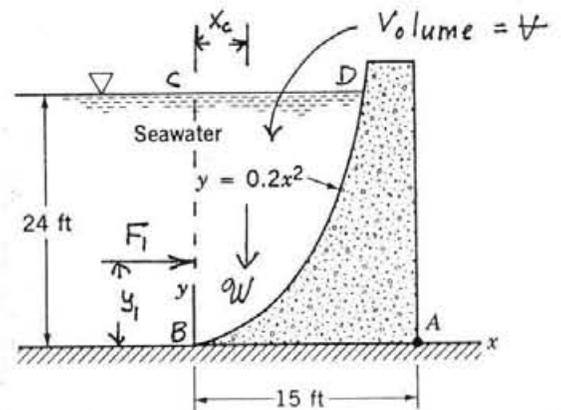

FIGURE P2.89

The components of the fluid force acting on the wall are F_1 and W as shown on the figure where

$$F_1 = \gamma h_c A = \left(64.0 \frac{\text{lb}}{\text{ft}^3}\right) \left(\frac{24 \text{ ft}}{2}\right) (24 \text{ ft} \times 1 \text{ ft})$$

$$= 18,400 \text{ lb} \quad \text{and} \quad y_1 = \frac{24 \text{ ft}}{3} = 8 \text{ ft}$$

Also,

$$W = \gamma V$$

To determine V find area BCD. Thus, (see figure to right)

$$A = \int_0^{x_0} (24 - y) dx = \int_0^{x_0} (24 - 0.2x^2) dx$$

$$= \left[24x - \frac{0.2x^3}{3}\right]_0^{x_0}$$

and with $x_0 = \sqrt{120}$, $A = 175 \text{ ft}^2$ so that

$$V = A \times 1 \text{ ft} = 175 \text{ ft}^3$$

$$\text{Thus, } W = \left(64.0 \frac{\text{lb}}{\text{ft}^3}\right) (175 \text{ ft}^3) = 11,200 \text{ lb}$$

To locate centroid of A:

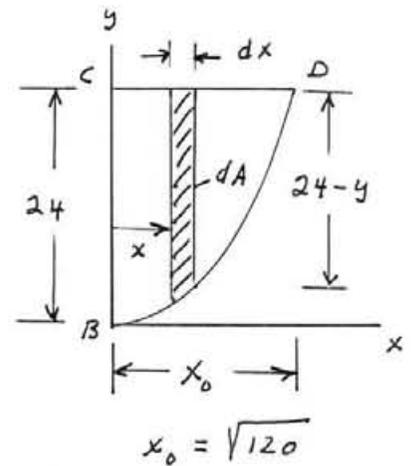

$$x_c A = \int_0^{x_0} x dA = \int_0^{x_0} (24 - y) x dx = \int_0^{x_0} (24x - 0.2x^3) dx = 12x_0^2 - \frac{0.2x_0^4}{4}$$

$$\text{and } x_c = \frac{12 (\sqrt{120})^2 - \frac{0.2 (\sqrt{120})^4}{4}}{175} = 4.11 \text{ ft}$$

Thus,

$$M_A = F_1 y_1 - W (15 - x_c)$$

$$= (18,400 \text{ lb})(8 \text{ ft}) - (11,200 \text{ lb})(15 \text{ ft} - 4.11 \text{ ft}) = \underline{\underline{25,200 \text{ ft}\cdot\text{lb}}}$$

(Note: All lengths in ft)
