NAME _____

Fluids-ID _____

Quiz 15. A 60-mph (i.e. 88-fps) wind of air ($\rho = 0.00238$ slugs/ft³ and $\nu = 1.57 \times 10^{-4}$ ft²/s) blows past the water tower shown in figures (a) and (b). Use the drag coefficient shown in figure (c), estimate the total drag, D , acting on the water tower. You may treat the water tower as a sphere resting on a circular cylinder and assume that the total drag is the sum of the drag from these parts, D_s and D_c , respectively.

Note: Attendance (+2 points), format (+1 point)
