

4.24 Determine the acceleration field for a three-dimensional flow with velocity components  $u = -x$ ,  $v = 4x^2y^2$ , and  $w = x - y$ .

$u = -x$ ,  $v = 4x^2y^2$ , and  $w = x - y$  so that

$$\begin{aligned} a_x &= \frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} \\ &= 0 + (-x)(-1) + 4x^2y^2(0) + (x-y)(0) = x \end{aligned}$$

$$\begin{aligned} a_y &= \frac{\partial v}{\partial t} + u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} \\ &= 0 + (-x)(8xy^2) + (4x^2y^2)(8x^2y) + (x-y)(0) \\ &= -8x^2y^2 + 32x^4y^3 = 8x^2y^2(4x^2y - 1) \end{aligned}$$

and

$$\begin{aligned} a_z &= \frac{\partial w}{\partial t} + u \frac{\partial w}{\partial x} + v \frac{\partial w}{\partial y} + w \frac{\partial w}{\partial z} \\ &= 0 + (-x)(1) + (4x^2y^2)(-1) + (x-y)(0) \\ &= -x - 4x^2y^2 \end{aligned}$$

Thus,

$$\begin{aligned} \vec{a} &= a_x \hat{i} + a_y \hat{j} + a_z \hat{k} \\ &= x \hat{i} + 8x^2y^2(4x^2y - 1) \hat{j} - (x + 4x^2y^2) \hat{k} \end{aligned}$$
