

Chapter 5 Finite Control Volume Analysis

5.1 Continuity Equation

RTT can be used to obtain an integral relationship expressing conservation of mass by defining the extensive property $B = M$ such that $\beta = 1$.

$$B = M = \text{mass}$$

$$\beta = dB/dM = 1$$

General Form of Continuity Equation

$$\frac{dM}{dt} = 0 = \frac{d}{dt} \int_{CV} \rho dV + \int_{CS} \rho \underline{V} \cdot \underline{dA}$$

or

$$\underbrace{\int_{CS} \rho \underline{V} \cdot \underline{dA}}_{\text{net rate of outflow of mass across CS}} = - \underbrace{\frac{d}{dt} \int_{CV} \rho dV}_{\text{rate of decrease of mass within CV}}$$

net rate of outflow of mass across CS rate of decrease of mass within CV

Simplifications:

1. Steady flow: $-\frac{d}{dt} \int_{CV} \rho dV = 0$
2. $\underline{V} = \text{constant over discrete } \underline{dA}$ (flow sections):

$$\int_{CS} \rho \underline{V} \cdot \underline{dA} = \sum_{CS} \rho \underline{V} \cdot A$$

3. Incompressible fluid ($\rho = \text{constant}$)

$$\int_{\text{CS}} \underline{\mathbf{V}} \cdot \underline{d\mathbf{A}} = -\frac{d}{dt} \int_{\text{CV}} d\underline{\mathbf{V}} \quad \text{conservation of volume}$$

4. Steady One-Dimensional Flow in a Conduit:

$$\sum_{\text{CS}} \rho \underline{\mathbf{V}} \cdot \underline{\mathbf{A}} = 0$$

$$-\rho_1 V_1 A_1 + \rho_2 V_2 A_2 = 0$$

$$\text{for } \rho = \text{constant} \quad Q_1 = Q_2$$

Some useful definitions:

Mass flux $\dot{m} = \int_A \rho \underline{\mathbf{V}} \cdot \underline{d\mathbf{A}}$

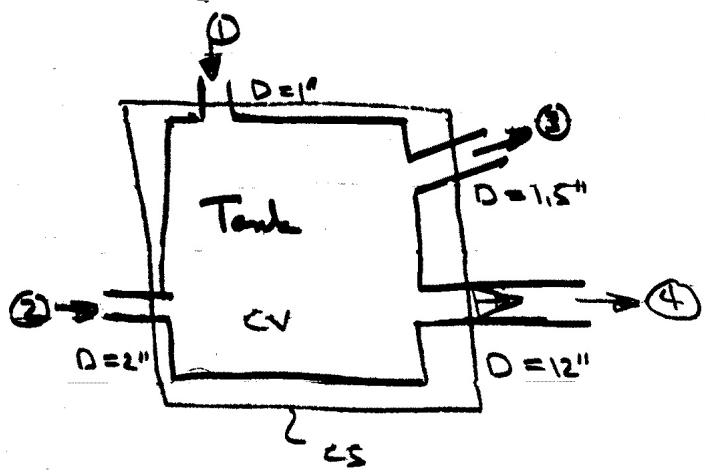

Volume flux $Q = \int_A \underline{\mathbf{V}} \cdot \underline{d\mathbf{A}}$

Average Velocity $\bar{\mathbf{V}} = Q / A$

Average Density $\bar{\rho} = \frac{1}{A} \int \rho dA$

Note: $\dot{m} \neq \bar{\rho}Q$ unless $\rho = \text{constant}$

Example

*Steady flow

$$*V_{1,2,3} = 50 \text{ fps}$$

*@ ∇ V varies linearly from zero at wall to V_{\max} at pipe center

*find \dot{m}_4 , Q_4 , V_{\max}

$$*\text{water, } \rho_w = 1.94 \text{ slug/ft}^3$$

$$\int_{CS} \rho V \cdot dA = 0 = - \frac{d}{dt} \int_{CV} \rho dV$$

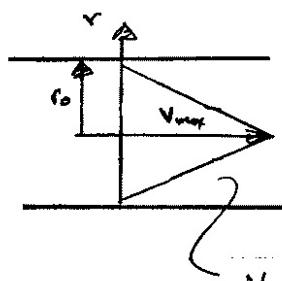

$$\dot{m}_4$$

$$\text{i.e., } -\rho_1 V_1 A_1 - \rho_2 V_2 A_2 + \rho_3 V_3 A_3 + \boxed{\rho \int_{A_4} V_4 dA_4} = 0$$

$$\rho = \text{const.} = 1.94 \text{ lb-s}^2/\text{ft}^4 = 1.94 \text{ slug/ft}^3$$

$$\dot{m}_4 = \rho \int V_4 dA_4 = \rho V (A_1 + A_2 - A_3) \quad V_1 = V_2 = V_3 = V = 50 \text{ f/s}$$

$$\begin{aligned} &= \frac{1.94}{144} \times 50 \times \frac{\pi}{4} (1^2 + 2^2 - 1.5^2) \\ &= 1.45 \text{ slugs/s} \end{aligned}$$

$$V = V_{\max} (1 - r/r_o), \quad dA = r dr d\theta$$

$$Q_4 = \dot{m}_4 / \rho = .75 \text{ ft}^3/\text{s}$$

$$= \int_{A_4} V_4 dA_4$$

$$Q_4 = \int_0^{r_o} \int_0^{2\pi} \underbrace{V_{\max} \left(1 - \frac{r}{r_o} \right) r d\theta dr}_{dA_4}$$

velocity profile

$$V_4 \neq V_4(\theta)$$

$$= 2\pi \int_0^{r_o} V_{\max} \left(1 - \frac{r}{r_o} \right) r dr$$

$$= 2\pi V_{\max} \int_0^{r_o} \left[r - \frac{r^2}{r_o} \right] dr$$

$$= 2\pi V_{\max} \left[\frac{r^2}{2} \Big|_0^{r_o} - \frac{r^3}{3r_o} \Big|_0^{r_o} \right]$$

$$\bar{V}_4 = \frac{Q}{A} = \frac{\frac{1}{3}\pi r_o^2 V_{\max}}{\pi r_o^2}$$

$$= \frac{1}{3} V_{\max}$$

$$= 2\pi V_{\max} r_o^2 \left[\frac{1}{2} - \frac{1}{3} \right] = \frac{1}{3} \pi r_o^2 V_{\max}$$

$$V_{\max} = \frac{Q_4}{\frac{1}{3}\pi r_o^2} = 2.86 \text{ fps}$$

5.2 Momentum Equation

RTT with $B = MV$ and $\beta = V$

$$\sum [F_S + F_B] = \frac{d}{dt} \int_{CV} \rho V dV + \int_{CS} V \rho V_R \cdot dA$$

V = velocity referenced to an inertial frame (non-accelerating)

V_R = velocity referenced to control volume

F_S = surface forces + reaction forces (due to pressure and viscous normal and shear stresses)

F_B = body force (due to gravity)

Applications of the Momentum Equation

Initial Setup and Signs

1. Jet deflected by a plate or a vane
2. Flow through a nozzle
3. Forces on bends
4. Problems involving non-uniform velocity distribution
5. Motion of a rocket
6. Force on rectangular sluice gate
7. Water hammer

Derivation of the Basic Equation

Recall RTT:
$$\frac{dB_{sys}}{dt} = \frac{d}{dt} \int_{CV} \beta \rho dV + \int_{CS} \beta \rho V_R \cdot dA$$

General form for moving but non-accelerating reference frame

V_R =velocity relative to CS= $V - V_s$ =absolute – velocity CS

Subscript not shown in text but implied!
 i.e., referenced to CV

Let, $B = MV$ = linear momentum
 $\beta = V$

V must be referenced to inertial reference frame

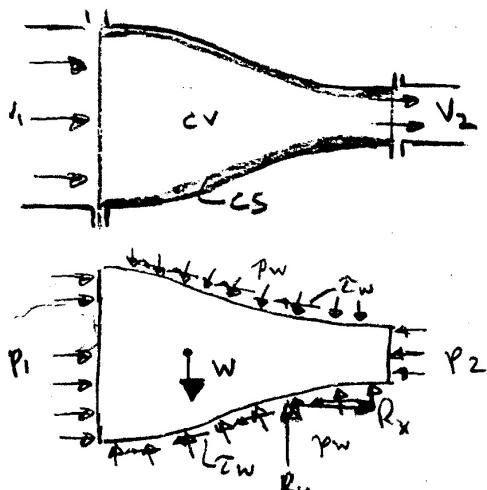

$$\underbrace{\frac{d(\underline{MV})}{dt}}_{\text{Newton's 2nd law}} = \sum \underline{F} = \frac{d}{dt} \int_{CV} \underline{V} \rho dV + \int_{CS} \underline{V} \rho \underline{V}_R \cdot dA$$

Must be relative to a non-accelerating
inertial reference frame

where $\sum \underline{F}$ = vector sum of all forces acting on the control volume including both surface and body forces

$$= \sum \underline{F}_S + \sum \underline{F}_B$$

$\sum \underline{F}_S$ = sum of all external surface forces acting at the CS, i.e., pressure forces, forces transmitted through solids, shear forces, etc.

free body diagram

$\sum \underline{F}_B$ = sum of all external body forces, i.e., gravity force

$$\sum F_x = p_1 A_1 - p_2 A_2 + R_x$$

$$\sum F_y = -W + R_y$$

R = resultant force on fluid in CV due to p_w and τ_w
i.e., reaction force on fluid

Important Features (to be remembered)

- 1) Vector equation to get component in any direction must use dot product

x equation

$$\sum F_x = \frac{d}{dt} \int_{CV} \rho u dV + \int_{CS} \rho u \underline{V}_R \cdot dA$$

Carefully define coordinate system with forces positive in positive direction of coordinate axes

y equation

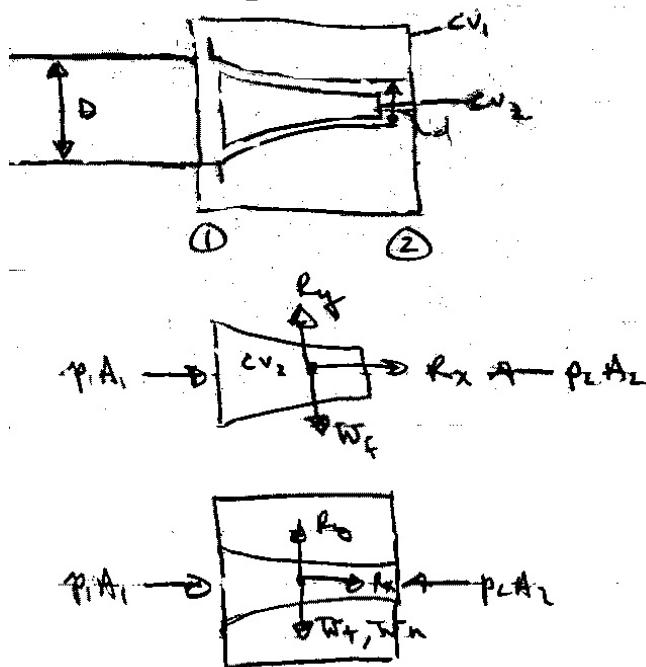

$$\sum F_y = \frac{d}{dt} \int_{CV} \rho v dV + \int_{CS} \rho v \underline{V}_R \cdot d\underline{A}$$

z equation

$$\sum F_z = \frac{d}{dt} \int_{CV} \rho w dV + \int_{CS} \rho w \underline{V}_R \cdot d\underline{A}$$

- 2) Carefully define control volume and be sure to include all external body and surface faces acting on it.

For example,

(R_x, R_y) = reaction force on fluid

(R_x, R_y) = reaction force on nozzle

- 3) Velocity \underline{V} must be referenced to a non-accelerating inertial reference frame. Sometimes it is advantageous to use a moving (at constant velocity) reference frame. Note $\underline{V}_R = \underline{V} - \underline{V}_s$ is always relative to CS.

↑
 i.e., in these cases \underline{V} used for B also referenced to CV
 (i.e., $\underline{V} = \underline{V}_R$)

4) Steady vs. Unsteady Flow

$$\text{Steady flow} \Rightarrow \frac{d}{dt} \int_{CV} \rho \underline{V} d\underline{V} = 0$$

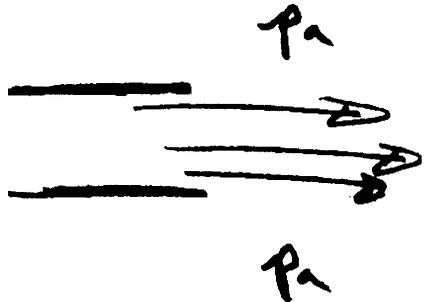

5) Uniform vs. Nonuniform Flow

$$\begin{aligned} \int_{CS} \underline{V} \rho \underline{V}_R \cdot d\underline{A} &= \text{change in flow of momentum across CS} \\ &= \sum \underline{V} \rho \underline{V}_R \cdot \underline{A} \quad \text{uniform flow across } \underline{A} \end{aligned}$$

$$\begin{aligned} 6) \quad \underline{E}_{\text{pres}} &= - \int_V p \underline{n} d\underline{A} \quad \int_V \nabla f d\underline{V} = \int_S f \underline{n} d\underline{s} \\ &\quad f = \text{constant}, \nabla f = 0 \\ &= 0 \quad \text{for } p = \text{constant and for a closed surface} \end{aligned}$$

i.e., always use gage pressure

7) Pressure condition at a jet exit

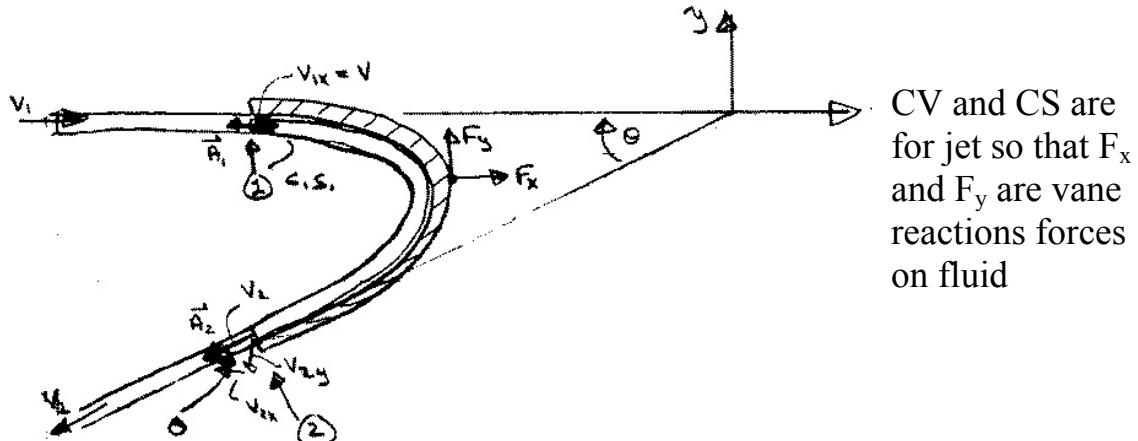

at an exit into the atmosphere jet pressure must be p_a

Application of the Momentum Equation

1. Jet deflected by a plate or vane

Consider a jet of water turned through a horizontal angle

x-equation: $\sum F_x = F_x = \frac{d}{dt} \int \rho u dV + \int_{CS} \rho u \underline{V} \cdot \underline{dA}$

$$F_x = \sum_{CS} \rho u \underline{V} \cdot \underline{A} \quad \text{steady flow}$$

$$= \rho V_{1x} (-V_1 A_1) + \rho V_{2x} (V_2 A_2)$$

continuity equation: $\rho A_1 V_1 = \rho A_2 V_2 = \rho Q$ for $A_1 = A_2$
 $V_1 = V_2$

$$F_x = \rho Q (V_{2x} - V_{1x})$$

y-equation: $\sum F_y = F_y = \sum_{CS} \rho v \underline{V} \cdot \underline{A}$

$$F_y = \rho V_{1y} (-A_1 V_1) + \rho V_{2y} (-A_2 V_2)$$

$$= \rho Q (V_{2y} - V_{1y})$$

where: $\overbrace{V_{1x} = V_1 \quad V_{2x} = -V_2 \cos \theta \quad V_{2y} = -V_2 \sin \theta \quad V_{1y} = 0}^{\text{for above geometry only}}$

note: F_x and F_y are force on fluid
 $-F_x$ and $-F_y$ are force on vane due to fluid

If the vane is moving with velocity \underline{V}_v , then it is convenient to choose CV moving with the vane

i.e., $\underline{V}_R = \underline{V} - \underline{V}_v$ and \underline{V} used for B also moving with vane

x-equation: $F_x = \int_{CS} \rho u \underline{V}_R \cdot d\underline{A}$

$$F_x = \rho V_{1x}[-(V - V_v)_1 A_1] + \rho V_{2x}[(V - V_v)_2 A_2]$$

Continuity: $0 = \int \rho \underline{V}_R \cdot d\underline{A}$

i.e., $\rho(V - V_v)_1 A_1 = \rho(V - V_v)_2 A_2 = \rho \underbrace{(V - V_v) A}_{Q_{rel}}$

$$F_x = \rho \underbrace{(V - V_v) A}_{Q_{rel}} [V_{2x} - V_{1x}]$$

↑

on fluid $V_{2x} = (V - V_v)_{2x}$
 $V_{1x} = (V - V_v)_{1x}$

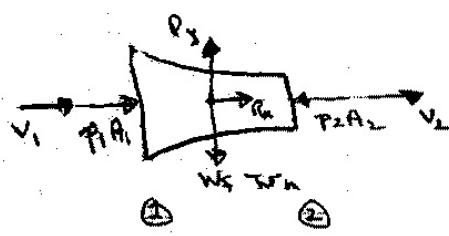

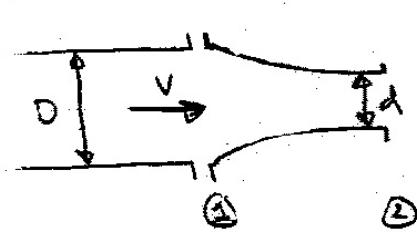

For coordinate system
 moving with vane

Power = $-F_x V_v$ i.e., = 0 for $V_v = 0$

$$F_y = \rho Q_{rel} (V_{2y} - V_{1y})$$

2. Flow through a nozzle

Consider a nozzle at the end of a pipe (or hose). What force is required to hold the nozzle in place?

$CV = \text{nozzle and fluid}$
 $\therefore (R_x, R_y) = \text{force required to hold nozzle in place}$

Assume either the pipe velocity or pressure is known. Then, the unknown (velocity or pressure) and the exit velocity V_2 can be obtained from combined use of the continuity and Bernoulli equations.

$$\text{Bernoulli: } p_1 + \gamma z_1 + \frac{1}{2} \rho V_1^2 = p_2 + \gamma z_2 + \frac{1}{2} \rho V_2^2 \quad z_1 = z_2$$

$$p_1 + \frac{1}{2} \rho V_1^2 = \frac{1}{2} \rho V_2^2$$

$$\text{Continuity: } A_1 V_1 = A_2 V_2 = Q$$

$$V_2 = \frac{A_1}{A_2} V_1 = \left(\frac{D}{d} \right)^2 V_1$$

$$p_1 + \frac{1}{2} \rho V_1^2 \left(1 - \left(\frac{D}{d} \right)^4 \right) = 0$$

$$\text{Say } p_1 \text{ known: } V_1 = \left[\frac{-2p_1}{\rho \left(1 - \left(\frac{D}{d} \right)^4 \right)} \right]^{1/2}$$

To obtain the reaction force R_x apply momentum equation in x-direction

$$\begin{aligned} \sum F_x &= \frac{d}{dt} \int_{CV} u \rho dV + \int_{CS} \rho u \underline{V} \cdot \underline{dA} \\ &= \sum_{CS} \rho u \underline{V} \cdot \underline{A} \quad \text{steady flow and uniform} \\ &\quad \text{flow over CS} \end{aligned}$$

$$R_x + p_1 A_1 - p_2 A_2 = \rho V_1 (-V_1 A_1) + \rho V_2 (V_2 A_2)$$

$$= \rho Q(V_2 - V_1)$$

$$R_x = \rho Q(V_2 - V_1) - p_1 A_1$$

To obtain the reaction force R_y apply momentum equation in y-direction

$$\sum F_y = \sum_{CS} \rho v \underline{V} \cdot \underline{A} = 0 \quad \text{since no flow in y-direction}$$

$$R_y - W_f - W_N = 0 \quad \text{i.e., } R_y = W_f + W_N$$

Numerical Example: Oil with $S = .85$ flows in pipe under pressure of 100 psi. Pipe diameter is 3" and nozzle tip diameter is 1"

$$V_1 = 14.59 \text{ ft/s}$$

$$V_2 = 131.3 \text{ ft/s}$$

$$R_x = 141.48 - 706.86 = -569 \text{ lbf}$$

$$R_z = 10 \text{ lbf}$$

$$\rho = \frac{S\gamma}{g} = 1.65$$

$$D/d = 3$$

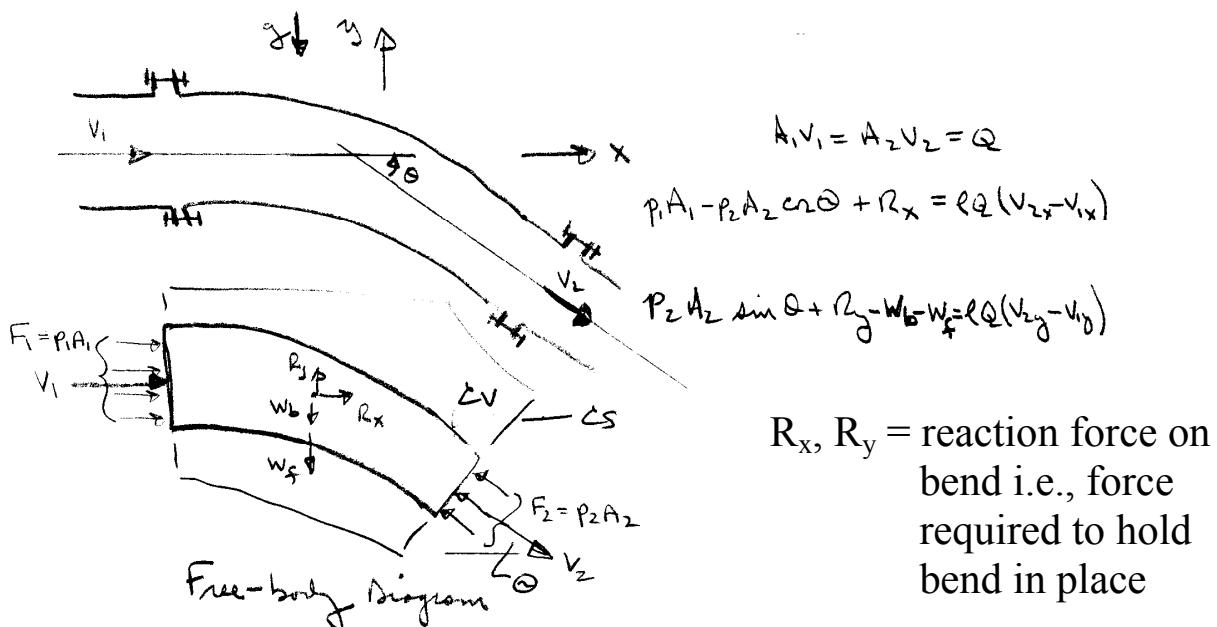

$$Q = \frac{\pi}{4} \left(\frac{1}{12} \right)^2 V_2$$

$$= .716 \text{ ft}^3/\text{s}$$

This is force on nozzle

3. Forces on Bends

Consider the flow through a bend in a pipe. The flow is considered steady and uniform across the inlet and outlet sections. Of primary concern is the force required to hold the bend in place, i.e., the reaction forces R_x and R_y which can be determined by application of the momentum equation.

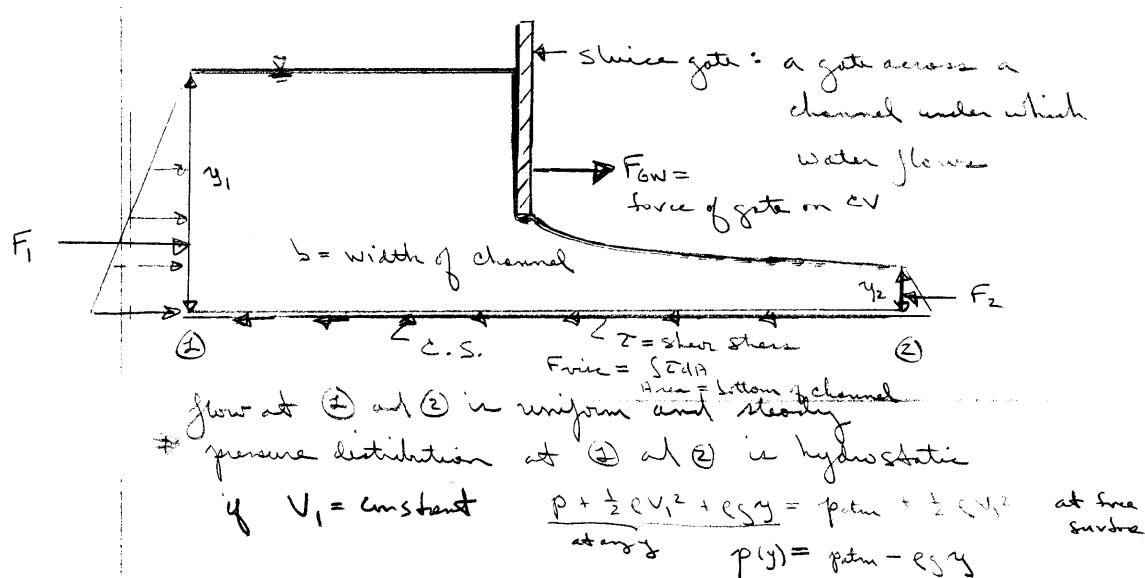

Continuity: $0 = \sum \rho \underline{V} \cdot \underline{A} = -\rho V_1 A_1 + \rho V_2 A_2$
 i.e., $Q = \text{constant} = V_1 A_1 = V_2 A_2$

x-momentum: $\sum F_x = \sum \rho u \underline{V} \cdot \underline{A}$
 $p_1 A_1 - p_2 A_2 \cos \theta + R_x = \rho V_{1x} (-V_1 A_1) + \rho V_{2x} (V_2 A_2)$
 $= \rho Q (V_{2x} - V_{1x})$

y-momentum: $\sum F_y = \sum \rho v \underline{V} \cdot \underline{A}$
 $p_2 A_2 \sin \theta + R_y - w_f - w_b = \rho V_{1y} (-V_1 A_1) + \rho V_{2y} (V_2 A_2)$
 $= \rho Q (V_{2y} - V_{1y})$

4. Force on a rectangular sluice gate

The force on the fluid due to the gate is calculated from the x-momentum equation:

$$\sum F_x = \sum \rho u \underline{V} \cdot \underline{A}$$

$$F_1 + F_{GW} - F_{visc} - F_2 = \rho V_1 (-V_1 A_1) + \rho V_2 (V_2 A_2)$$

$$F_{GW} = F_2 - F_1 + \rho Q (V_2 - V_1) + \cancel{F_{visc}} \quad \text{usually can be neglected}$$

$$= \gamma \frac{y_2}{2} \cdot y_2 b - \gamma \frac{y_1}{2} \cdot y_1 b + \rho Q (V_2 - V_1)$$

$$F_{GW} = \frac{1}{2} b \gamma (y_2^2 - y_1^2) + \underbrace{\rho Q^2 \left(\frac{1}{y_2} - \frac{1}{y_1} \right)}_{b}$$

$$V_1 = \frac{Q}{y_1 b}$$

$$V_2 = \frac{Q}{y_2 b}$$

5. Application of relative inertial coordinates for a moving but non-deforming control volume (CV)

The CV moves at a constant velocity \underline{V}_{CS} with respect to the absolute inertial coordinates. If \underline{V}_R represents the velocity in the relative inertial coordinates that move together with the CV, then:

$$\underline{V}_R = \underline{V} - \underline{V}_{CS}$$

Reynolds transport theorem for an arbitrary moving deforming CV:

$$\frac{dB_{SYS}}{dt} = \frac{d}{dt} \int_{CV} \beta \rho dV + \int_{CS} \beta \rho \underline{V}_R \cdot \underline{n} dA$$

For a non-deforming CV moving at constant velocity, RTT for incompressible flow:

$$\frac{dB_{syst}}{dt} = \rho \int_{CV} \frac{\partial \beta}{\partial t} dV + \rho \int_{CS} \beta \underline{V}_R \cdot \underline{n} dA$$

1) Conservation of mass

$B_{syst} = M$, and $\beta = 1$:

$$\frac{dM}{dt} = \rho \int_{CS} \underline{V}_R \cdot \underline{n} dA$$

For steady flow:

$$\int_{CS} \underline{V}_R \cdot \underline{n} dA = 0$$

2) Conservation of momentum

$$B_{syst} = M(\underline{V}_R + \underline{V}_{CS}) \text{ and } \beta = d\underline{B}_{syst}/dM = \underline{V}_R + \underline{V}_{CS}$$

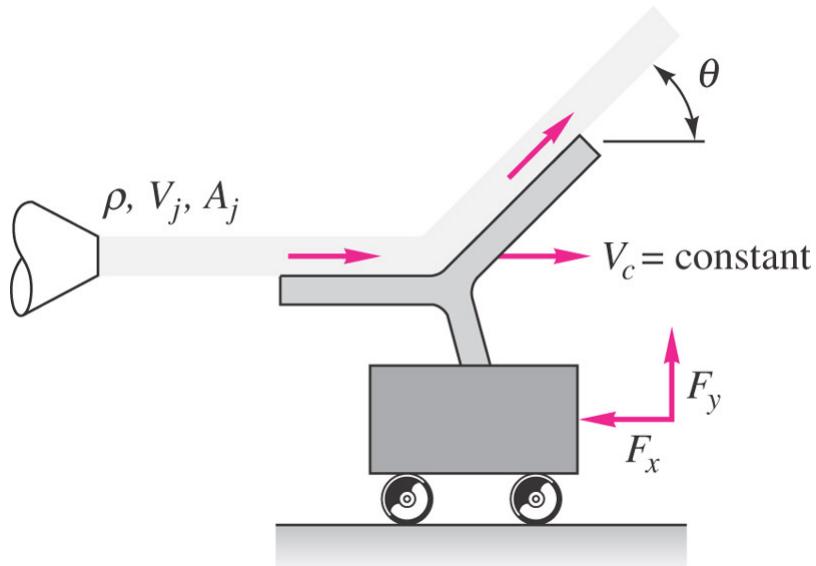

$$\frac{d[M(\underline{V}_R + \underline{V}_{CS})]}{dt} = \sum \underline{F} = \rho \int_{CV} \frac{\partial (\underline{V}_R + \underline{V}_{CS})}{\partial t} dV + \rho \int_{CS} (\underline{V}_R + \underline{V}_{CS}) \underline{V}_R \cdot \underline{n} dA$$

For steady flow with the use of continuity:

$$\begin{aligned} \sum \underline{F} &= \rho \int_{CS} (\underline{V}_R + \underline{V}_{CS}) \underline{V}_R \cdot \underline{n} dA \\ &= \rho \int_{CS} \underline{V}_R \underline{V}_R \cdot \underline{n} dA + \rho \underline{V}_{CS} \int_{CS} \underline{V}_R \cdot \underline{n} dA^0 \\ \sum \underline{F} &= \rho \int_{CS} \underline{V}_R \underline{V}_R \cdot \underline{n} dA \end{aligned}$$

Example (use relative inertial coordinates):

Ex) A jet strikes a vane which moves to the right at constant velocity v_c on a frictionless cart. Compute (a) the force F_x required to restrain the cart and (b) the power P delivered to the cart. Also find the cart velocity for which (c) the force F_x is a maximum and (d) the power P is a maximum.

Solution:

Assume relative inertial coordinates with non-deforming CV i.e. CV moves at constant translational non-accelerating

$$\underline{V}_{CS} = u_{CS}\hat{i} + v_{CS}\hat{j} + w_{CS}\hat{k} = V_C\hat{i}$$

then $\underline{V}_R = \underline{V} - \underline{V}_{CS}$. Also assume steady flow $\underline{V} \neq \underline{V}(t)$ with $\rho = \text{constant}$ and neglect gravity effect.

Continuity:

$$\int_{CS} \underline{V}_R \cdot \underline{n} dA = 0$$

Bernoulli without gravity:

$$\cancel{\rho}^0 + \frac{1}{2} \rho V_{R1}^2 = \cancel{\rho}^0 + \frac{1}{2} \rho V_{R2}^2$$

$$V_{R1} = V_{R2}$$

Since

$$\rho V_{R1} A_1 = \rho V_{R2} A_2$$

$$A_1 = A_2 = A_j$$

Momentum:

$$\sum \underline{F} = \rho \int_{CS} \underline{V}_R \underline{V}_R \cdot \underline{n} dA$$

$$\sum F_x = -F_x = \rho \int_{CS} V_{Rx} \underline{V}_R \cdot \underline{n} dA$$

$$-F_x = \rho V_{Rx1} (-V_{R1} A_1) + \rho V_{Rx2} (V_{R2} A_2)$$

$$0 = \rho \int_{CS} \underline{V}_R \cdot \underline{n} dA$$

$$-\rho V_{R1} A_1 + \rho V_{R2} A_2 = 0$$

$$V_{R1} A_1 = V_{R2} A_2 = \underbrace{(V_j - V_C)}_{V_{R1} = V_{Rx1} = V_j - V_C} A_j$$

$$-F_x = \rho(V_j - V_c)[-(V_j - V_c)A_j] + \rho(V_j - V_c)\cos\theta(V_j - V_c)A_j$$

$$F_x = \rho(V_j - V_c)^2 A_j [1 - \cos\theta]$$

$$Power = V_c F_x = V_c \rho(V_j - V_c)^2 A_j (1 - \cos\theta)$$

$$F_{x_{max}} = \rho V_j^2 A_j (1 - \cos\theta), \quad V_c = 0$$

$$P_{max} \Rightarrow \frac{dP}{dV_c} = 0$$

$$P = V_c \rho(V_j^2 - 2V_c V_j + V_c^2) A_j (1 - \cos\theta)$$

$$= \rho(V_j^2 V_c - 2V_c^2 V_j + V_c^3) A_j (1 - \cos\theta)$$

$$\frac{dP}{dV_c} = \rho(V_j^2 - 4V_c V_j + 3V_c^2) A_j (1 - \cos\theta) = 0$$

$$3V_c^2 - 4V_j V_c + V_j^2 = 0$$

$$V_c = \frac{+4V_j \pm \sqrt{16V_j^2 - 12V_j^2}}{6} = \frac{4V_j \pm 2V_j}{6}$$

$$V_c = \frac{V_j}{3}$$

$$P_{max} = \frac{V_j}{3} \rho \left(\frac{2V_j}{3} \right)^2 A_j (1 - \cos\theta)$$

$$= \frac{4}{27} V_j^3 \rho A_j (1 - \cos\theta)$$

5.3 Energy Equation

Derivation of the Energy Equation

The First Law of Thermodynamics

The difference between the heat added to a system and the work done by a system depends only on the initial and final states of the system; that is, depends only on the change in energy E: principle of conservation of energy

$$\Delta E = Q - W$$

ΔE = change in energy

Q = heat added to the system

W = work done by the system

$$E = E_u + E_k + E_p \underset{\text{Internal energy due to molecular motion}}{\overset{\text{potential energy}}{\underset{\text{kinetic energy}}{\equiv}}} \text{total energy of the system}$$

Internal energy due to molecular motion

The differential form of the first law of thermodynamics expresses the rate of change of E with respect to time

$$\frac{dE}{dt} = \dot{Q} - \dot{W}$$

↑ ↓
rate of heat transfer to system rate of work being done by system

Energy Equation for Fluid Flow

The energy equation for fluid flow is derived from Reynolds transport theorem with

$B_{\text{system}} = E = \text{total energy of the system (extensive property)}$

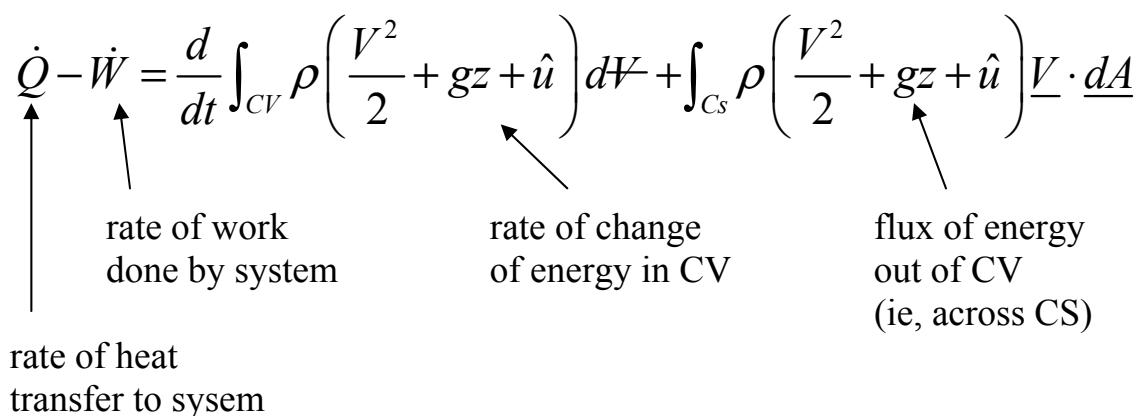

$$\begin{aligned}\beta &= E/\text{mass} = e = \text{energy per unit mass (intensive property)} \\ &= \hat{u} + e_k + e_p\end{aligned}$$

$$\begin{aligned}\frac{dE}{dt} &= \frac{d}{dt} \int_{CV} \rho e dV + \int_{CS} \rho e \underline{V} \cdot \underline{dA} \\ \dot{Q} - \dot{W} &= \frac{d}{dt} \int_{CV} \rho (\hat{u} + e_k + e_p) dV + \int_{CS} \rho (\hat{u} + e_k + e_p) \underline{V} \cdot \underline{dA}\end{aligned}$$

This can be put in a more useable form by noting the following:

$$\begin{aligned}e_k &= \frac{\text{Total KE of mass with velocity } V}{\text{mass}} = \frac{\Delta M V^2 / 2}{\Delta M} = \frac{V^2}{2} \quad V^2 = |\underline{V}| \\ e_p &= \frac{E_p}{\Delta M} = \frac{\gamma \Delta V z}{\rho \Delta V} = gz \quad (\text{for } E_p \text{ due to gravity only})\end{aligned}$$

$$\dot{Q} - \dot{W} = \frac{d}{dt} \int_{CV} \rho \left(\frac{V^2}{2} + gz + \hat{u} \right) dV + \int_{CS} \rho \left(\frac{V^2}{2} + gz + \hat{u} \right) \underline{V} \cdot \underline{dA}$$

 rate of work done by system rate of change of energy in CV flux of energy out of CV (ie, across CS)

↑
 rate of heat transfer to system

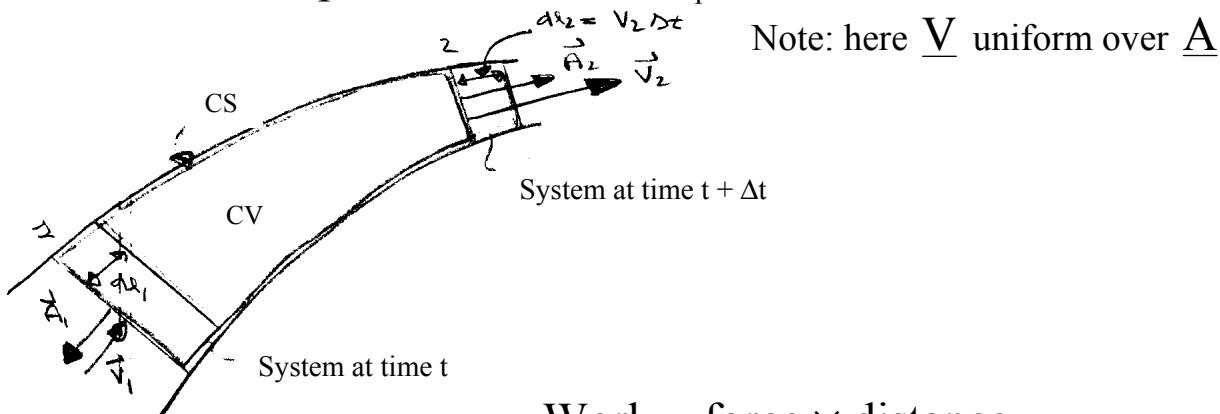

Rate of Work Components: $\dot{W} = \dot{W}_s + \dot{W}_f$

For convenience of analysis, work is divided into shaft work W_s and flow work W_f

W_f = net work done on the surroundings as a result of normal and tangential stresses acting at the control surfaces
 $= W_{f\text{ pressure}} + W_{f\text{ shear}}$

W_s = any other work transferred to the surroundings usually in the form of a shaft which either takes energy out of the system (turbine) or puts energy into the system (pump)

Flow work due to pressure forces W_{fp} (for system)

Work = force \times distance

$$\text{at } 2 \quad W_2 = p_2 A_2 \times V_2 \Delta t \quad (\text{on surroundings})$$

$$\text{rate of work} \Rightarrow \dot{W}_2 = p_2 A_2 V_2 = p_2 \underline{V}_2 \cdot \underline{A}_2$$

neg. sign since pressure force on surrounding fluid acts in a direction opposite to the motion of the system boundary

$$\text{at } 1 \quad W_1 = -p_1 A_1 \times V_1 \Delta t$$

$$\dot{W}_1 = p_1 \underline{V}_1 \cdot \underline{A}_1$$

In general,

$$\dot{W}_{fp} = p \underline{V} \cdot \underline{A}$$

for more than one control surface and \underline{V} not necessarily uniform over \underline{A} :

$$\dot{W}_{fp} = \int_{CS} p \underline{V} \cdot \underline{dA} = \int_{CS} \rho \left(\frac{p}{\rho} \right) \underline{V} \cdot \underline{dA}$$

$$\dot{W}_f = \dot{W}_{fp} + \dot{W}_{fshear}$$

Basic form of energy equation

$$\begin{aligned} \dot{Q} - \dot{W}_s - \dot{W}_{fshear} - \int_{CS} \rho \left(\frac{p}{\rho} \right) \underline{V} \cdot \underline{dA} \\ = \frac{d}{dt} \int_{CV} \rho \left(\frac{V^2}{2} + gz + \hat{u} \right) dV + \int_{CS} \rho \left(\frac{V^2}{2} + gz + \hat{u} \right) \underline{V} \cdot \underline{dA} \end{aligned}$$

$$\cancel{\dot{Q} - \dot{W}_s - \dot{W}_{shear}} = \frac{d}{dt} \int_{CV} \rho \left(\frac{V^2}{2} + gz + \hat{u} \right) dV$$

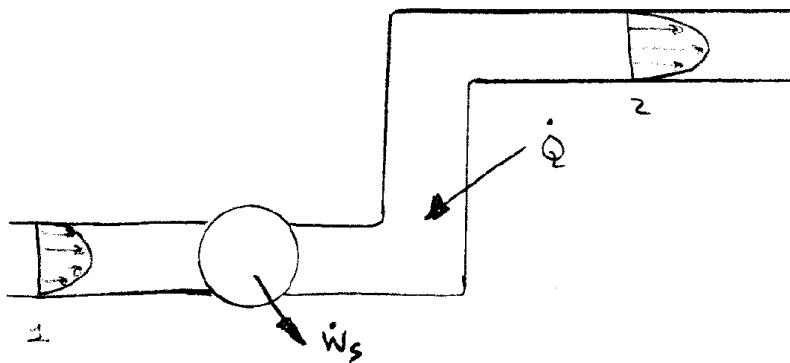

Usually this term can be eliminated by proper choice of CV, i.e. CS normal to flow lines.
 Also, at fixed boundaries the velocity is zero (no slip condition) and no shear stress flow work is done. Not included or discussed in text!

$$+ \int_{CS} \rho \left(\frac{V^2}{2} + gz + \hat{u} + \underbrace{\frac{p}{\rho}}_{h=\text{enthalpy}} \right) \underline{V} \cdot \underline{dA}$$

Simplified Forms of the Energy Equation

Energy Equation for Steady One-Dimensional Pipe Flow

Consider flow through the pipe system as shown

Energy Equation (steady flow)

$$\begin{aligned}\dot{Q} - \dot{W}_s &= \int_{CS} \rho \left(\frac{V^2}{2} + gz + \frac{p}{\rho} + \hat{u} \right) \underline{V} \cdot d\underline{A} \\ \dot{Q} - \dot{W}_s + \int_{A_1} \left(\frac{p_1}{\rho} + gz_1 + \hat{u}_1 \right) \rho_1 V_1 A_1 + \int_{A_1} \frac{\rho_1 V_1^3}{2} dA_1 \\ &= \int_{A_2} \left(\frac{p_2}{\rho} + gz_2 + \hat{u}_2 \right) \rho_2 V_2 A_2 + \int_{A_2} \frac{\rho_2 V_2^3}{2} dA_2\end{aligned}$$

*Although the velocity varies across the flow sections the streamlines are assumed to be straight and parallel; consequently, there is no acceleration normal to the streamlines and the pressure is hydrostatically distributed, i.e., $p/\rho + gz = \text{constant}$.

*Furthermore, the internal energy u can be considered as constant across the flow sections, i.e. $T = \text{constant}$. These quantities can then be taken outside the integral sign to yield

$$\dot{Q} - \dot{W}_s + \left(\frac{p_1}{\rho} + gz_1 + \hat{u}_1 \right) \rho \int_{A_1} V_1 dA_1 + \rho \int_{A_1} \frac{V_1^3}{2} dA_1$$

$$= \left(\frac{p_2}{\rho} + gz_2 + \hat{u}_2 \right) \rho \int_{A_2} V_2 dA_2 + \rho \int_{A_2} \frac{V_2^3}{2} dA_2$$

Recall that $Q = \int \underline{V} \cdot \underline{dA} = \bar{V} A$

So that $\rho \int \underline{V} \cdot \underline{dA} = \rho \bar{V} A = \dot{m}$ mass flow rate

Define:
$$\underbrace{\rho \int_A \frac{V^3}{2} dA}_{\text{K.E. flux}} = \alpha \underbrace{\frac{\rho \bar{V}^3 A}{2}}_{\text{K.E. flux for } V = \bar{V}} = \alpha \frac{\bar{V}^2}{2} \dot{m}$$

 $\text{constant across pipe}$

i.e., $\alpha = \frac{1}{A} \int_A \left(\frac{V}{\bar{V}} \right)^3 dA$ = kinetic energy correction factor

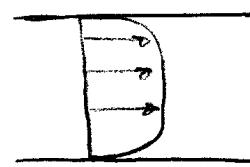

$$\dot{Q} - \dot{W} + \left(\frac{p_1}{\rho} + gz_1 + \hat{u}_1 + \alpha_1 \frac{\bar{V}_1^2}{2} \right) \dot{m} = \left(\frac{p_2}{\rho} + gz_2 + \hat{u}_2 + \alpha_2 \frac{\bar{V}_2^2}{2} \right) \dot{m}$$

$$\frac{1}{\dot{m}} (\dot{Q} - \dot{W}) + \frac{p_1}{\rho} + gz_1 + \hat{u}_1 + \alpha_1 \frac{\bar{V}_1^2}{2} = \frac{p_2}{\rho} + gz_2 + \hat{u}_2 + \alpha_2 \frac{\bar{V}_2^2}{2}$$

Note that: $\alpha = 1$ if V is constant across the flow section
 $\alpha > 1$ if V is nonuniform

laminar flow $\alpha = 2$

turbulent flow $\alpha = 1.05 \sim 1$ may be used

Shaft Work

Shaft work is usually the result of a turbine or a pump in the flow system. When a fluid passes through a turbine, the fluid is doing shaft work on the surroundings; on the other hand, a pump does work on the fluid

$$\dot{W}_s = \dot{W}_t - \dot{W}_p \quad \text{where } \dot{W}_t \text{ and } \dot{W}_p \text{ are}$$

magnitudes of power $\left(\frac{\text{work}}{\text{time}} \right)$

Using this result in the energy equation and deviding by g results in

$$\underbrace{\frac{\dot{W}_p}{\dot{m}g} + \frac{p_1}{\gamma} + z_1 + \alpha_1 \frac{\bar{V}_1^2}{2}}_{\text{mechanical part}} = \underbrace{\frac{\dot{W}_t}{\dot{m}g} + \frac{p_2}{\gamma} + z_2 + \alpha_2 \frac{\bar{V}_2^2}{2} + \frac{\hat{u}_2 - \hat{u}_1}{g} - \frac{\dot{Q}}{\dot{m}g}}_{\text{thermal part}}$$

Note: each term has dimensions of length

Define the following:

$$h_p = \frac{\dot{W}_p}{\dot{m}g} = \frac{\dot{W}_p}{\rho Q g} = \frac{\dot{W}_p}{\gamma Q}$$

$$h_t = \frac{\dot{W}_t}{\dot{m}g}$$

$$h_L = \frac{\hat{u}_2 - \hat{u}_1}{g} - \frac{\dot{Q}}{\dot{m}g} = \text{head loss}$$

Head Loss

In a general fluid system a certain amount of mechanical energy is converted to thermal energy due to viscous action. This effect results in an increase in the fluid internal energy. Also, some heat will be generated through energy dissipation and be lost (i.e. $-\dot{Q}$). Therefore the term

$$h_L = \frac{\hat{u}_2 - \hat{u}_1}{g} - \frac{\dot{Q}}{g\dot{m}} > 0$$

from 2nd law

represents a loss in mechanical energy due to viscous stresses

Note that adding \dot{Q} to system will not make $h_L = 0$ since this also increases Δu . It can be shown from 2nd law of thermodynamics that $h_L > 0$.

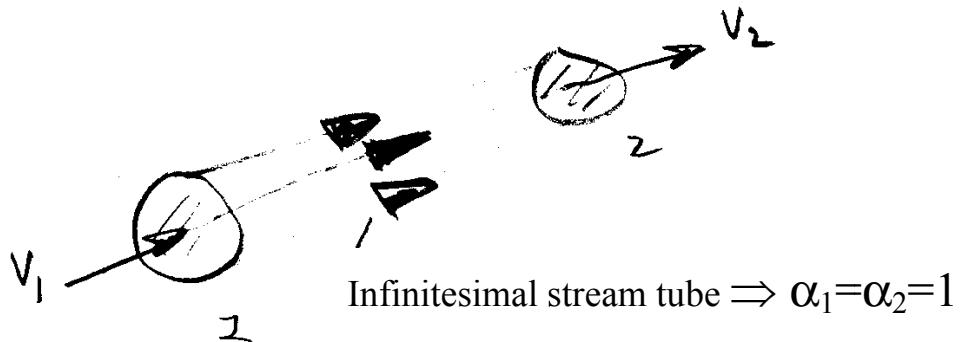

Drop — over \bar{V} and understand that V in energy equation refers to average velocity.

Using the above definitions in the energy equation results in (steady 1-D incompressible flow)

$$\underbrace{\frac{p_1}{\gamma} + \alpha_1 \frac{V_1^2}{2g} + z_1 + h_p}_{\text{form of energy equation used for this course!}} = \underbrace{\frac{p_2}{\gamma} + \alpha_2 \frac{V_2^2}{2g} + z_2 + h_t + h_L}_{\text{}}$$

Comparison of Energy Equation and Bernoulli Equation

Apply energy equation to a stream tube without any shaft work

$$\text{Energy eq : } \frac{p_1}{\gamma} + \frac{V_1^2}{2g} + z_1 = \frac{p_2}{\gamma} + \frac{V_2^2}{2g} + z_2 + h_L$$

- If $h_L = 0$ (i.e., $\mu = 0$) we get Bernoulli equation and conservation of mechanical energy along a streamline
- Therefore, energy equation for steady 1-D pipe flow can be interpreted as a modified Bernoulli equation to include viscous effects (h_L) and shaft work (h_p or h_t)

Summary of the Energy Equation

The energy equation is derived from RTT with

$B = E = \text{total energy of the system}$

$\beta = e = E/M = \text{energy per unit mass}$

$$= \hat{u} + \frac{1}{2}V^2 + gz$$

internal KE PE

$$\frac{dE}{dt} = \frac{d}{dt} \int_{CV} \rho e dV + \int_{CS} \rho e \underline{V} \cdot \underline{dA} = \dot{Q} - \dot{W}$$

heat add work done

from 1st Law of Thermodynamics

$$\dot{W} = \dot{W}_s + \dot{W}_p + \dot{W}_v$$

Neglected in text presentation

shaft work done on or by system (pump or turbine)

pressure work done on CS

Viscous stress work on CS

$$\dot{W}_p = \int_{CV} p \underline{V} \cdot \underline{dA} = \int_{CS} \rho(p/\rho) \underline{V} \cdot \underline{dA}$$

$$\dot{W}_s = \dot{W}_t - \dot{W}_p$$

$$\dot{Q} - \dot{W}_t + \dot{W}_p = \frac{d}{dt} \int_{CV} \rho e dV + \int_{CS} \rho(e + p/e) \underline{V} \cdot \underline{dA}$$

$$e = \hat{u} + \frac{1}{2}V^2 + gz$$

For steady 1-D pipe flow (one inlet and one outlet):

1) Streamlines are straight and parallel

$$\Rightarrow p/\rho + gz = \text{constant across CS}$$

2) $T = \text{constant} \Rightarrow u = \text{constant}$ across CS

3) define $\alpha = \frac{1}{A_{\text{CS}}} \int \left(\frac{\bar{V}}{\bar{V}} \right)^3 dA = \text{KE correction factor}$

$$\Rightarrow \frac{\rho}{2} \int V^3 dA = \alpha \frac{\rho \bar{V}^3}{2} A = \alpha \frac{\bar{V}^2}{2} \dot{m}$$

$$\underbrace{\frac{p_1}{\gamma} + \alpha_1 \frac{V_1^2}{2g} + z_1 + h_p}_{\text{mechanical energy}} = \underbrace{\frac{p_2}{\gamma} + \alpha_2 \frac{V_2^2}{2g} + z_2 + h_t + h_L}_{\text{Thermal energy}}$$

$$h_p = \dot{W}_p / \dot{m}g$$

Note: each term has

units of length

$$h_t = \dot{W}_t / \dot{m}g$$

V is average velocity
 (vector dropped) and
 corrected by α

$$h_L = \frac{\hat{u}_2 - \hat{u}_1}{g} - \frac{\dot{Q}}{\dot{m}g} = \text{head loss}$$

> 0 represents loss in mechanical energy due to viscosity

Concept of Hydraulic and Energy Grade Lines

$$\frac{p_1}{\gamma} + \alpha_1 \frac{V_1^2}{2g} + z_1 + h_p = \frac{p_2}{\gamma} + \alpha_2 \frac{V_2^2}{2g} + z_2 + h_t + h_L$$

Define $HGL = \frac{p}{\gamma} + z$

$$EGL = \frac{p}{\gamma} + z + \alpha \frac{V^2}{2g}$$

} point-by-point application is graphically displayed

HGL corresponds to pressure tap measurement + z

EGL corresponds to stagnation tube measurement + z

$EGL_1 = EGL_2 + h_L$
 for $h_p = h_t = 0$

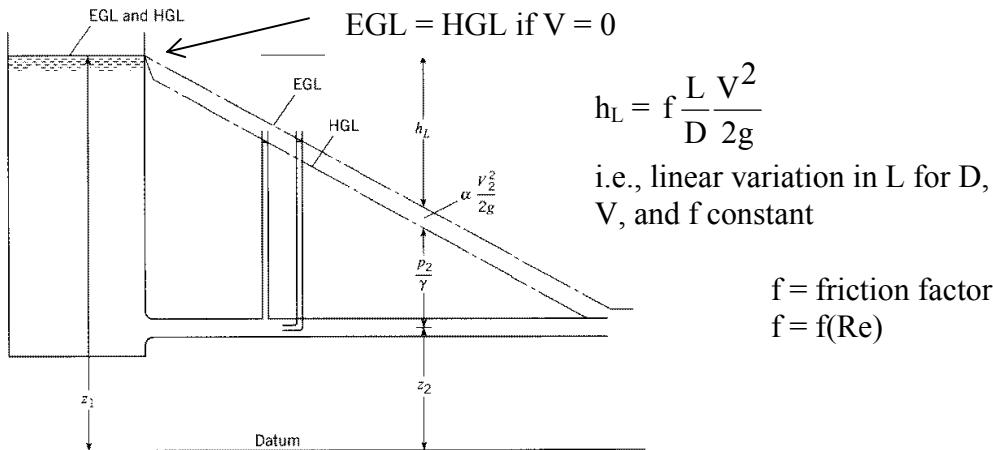

FIGURE 7.4
EGL and HGL in a straight pipe.

pressure tap: $\frac{p_2}{\gamma} = h$

stagnation tube: $\frac{p_2}{\gamma} + \alpha \frac{V_2^2}{2g} = h$

} $h = \text{height of fluid in tap/tube}$

$$EGL_1 + h_p = EGL_2 + h_t + h_L$$

$$EGL_2 = EGL_1 + \underbrace{h_p - h_t - h_L}_{\text{abrupt change due to } h_p \text{ or } h_t}$$

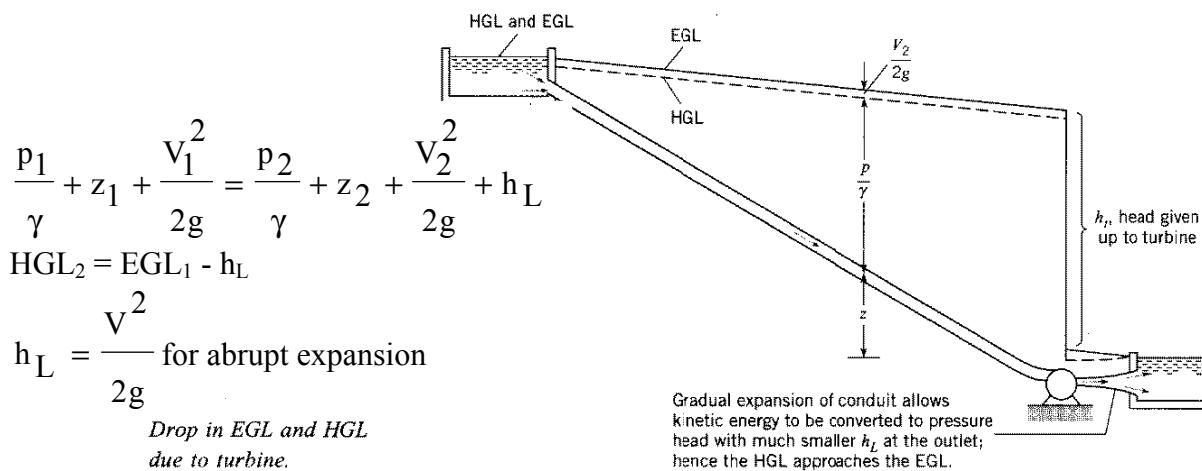

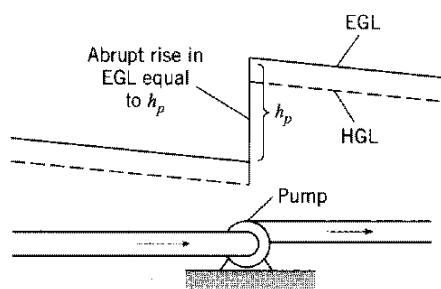

$$f \frac{L}{D} \frac{V^2}{2g}$$

Helpful hints for drawing HGL and EGL

$$1. \text{ EGL} = \text{HGL} + \alpha V^2 / 2g = \text{HGL} \text{ for } V = 0$$

2.&3. $h_L = f \frac{L}{D} \frac{V^2}{2g}$ in pipe means EGL and HGL will slope downward, except for abrupt changes due to h_t or h_p

FIGURE 7.5
Rise in EGL and HGL due to pump.

4. $p = 0 \Rightarrow HGL = z$

5. for $h_L = f \frac{L}{D} \frac{V^2}{2g} = \text{constant} \times L$

EGL/HGL slope downward

i.e., linearly increased for increasing L with slope $\frac{f}{D} \frac{V^2}{2g}$

6. for change in $D \Rightarrow$ change in V

i.e. $V_1 A_1 = V_2 A_2$
 $V_1 \frac{\pi D_1^2}{4} = V_2 \frac{\pi D_2^2}{4}$
 $V_1 D_1^2 = V_2 D_2^2$

change in distance between HGL & EGL and slope change due to change in h_L

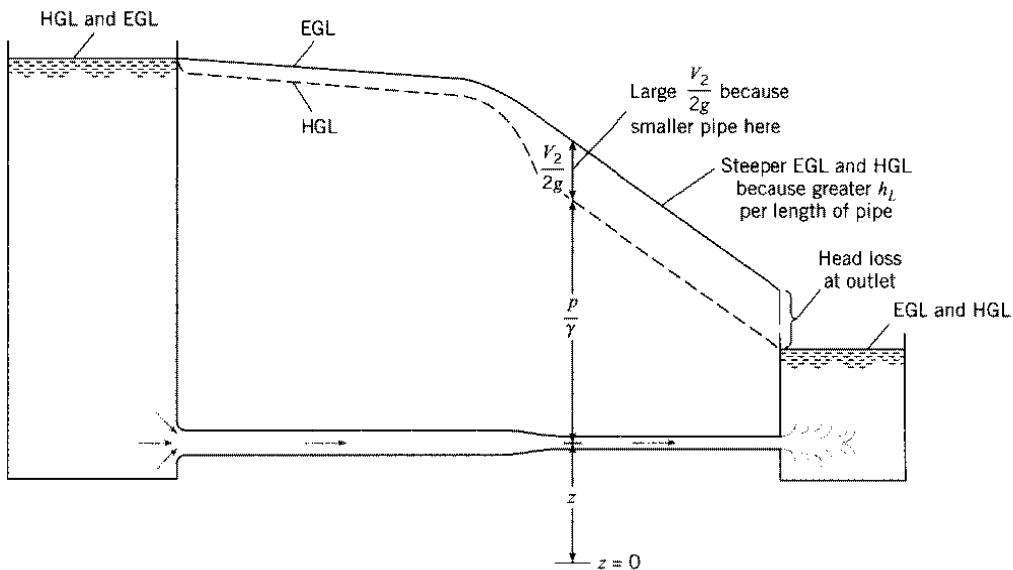

FIGURE 7.8
*Change in EGL and HGL
 due to change in
 diameter of pipe.*

7. If $HGL < z$ then $p/\gamma < 0$ i.e., cavitation possible

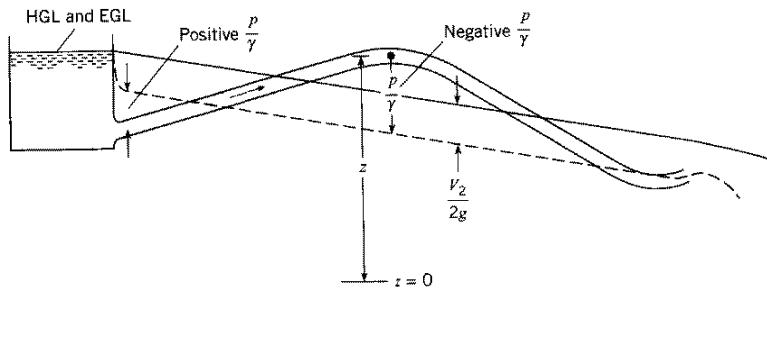

FIGURE 7.9
Subatmospheric pressure when pipe is above HGL.

condition for cavitation:

$$p = p_{va} = 2000 \frac{N}{m^2}$$

gage pressure $p_{va,g} = p_A - p_{atm} \approx -p_{atm} = -100,000 \frac{N}{m^2}$

$$\frac{p_{va,g}}{\gamma} \approx -10m$$

9810 N/m³

108 4 Energy Considerations in Steady Flow

4.15 METHOD OF SOLUTION OF FLOW PROBLEMS

For the solutions of problems of liquid flow there are two fundamental equations, the equation of continuity (3.10) and the energy equation in one of the forms from Eqs. (4.5) to (4.10). The following procedure may be employed:

1. Choose a datum plane through any convenient point.
2. Note at what sections the velocity is known or is to be assumed. If at any point the section area is great compared with its value elsewhere, the velocity head is so small that it may be disregarded.
3. Note at what points the pressure is known or is to be assumed. In a body of liquid at rest with a free surface the pressure is known at every point within the body. The pressure in a jet is the same as that of the medium surrounding the jet.
4. Note whether or not there is any point where all three terms, pressure, elevation, and velocity, are known.
5. Note whether or not there is any point where there is only one unknown quantity.

It is generally possible to write an energy equation that will fulfill conditions 4 and 5. If there are two unknowns in the equation, then the continuity equation must be used also. The application of these principles is shown in the following illustrative examples.

Illustrative Example 4.7 A pipeline with a pump leads to a nozzle as shown in the accompanying figure. Find the flow rate when the pump develops a head of 80 ft. Assume that the head loss in the 6-in-diameter pipe may be expressed by $h_L = 5V_1^2/2g$, while the head loss in the 4-in-diameter pipe is $h_L = 12V_4^2/2g$. Sketch the energy line and hydraulic grade line, and find the pressure head at the suction side of the pump.

Select the datum as the elevation of the water surface in the reservoir. Note from continuity that

$$V_6 = \left(\frac{3}{8}\right)^2 V_3 = 0.25V_3 \quad \text{and} \quad V_4 = \left(\frac{2}{4}\right)^2 V_3 = 0.563V_3$$

where V_3 is the jet velocity. Writing an energy equation from the surface of the reservoir to the jet,

$$\begin{aligned} \left(z_1 + \frac{p_1}{\gamma} + \frac{V_1^2}{2g}\right) - h_{L_1} + h_p - h_{L_4} &= z_3 + \frac{p_3}{\gamma} + \frac{V_3^2}{2g} \\ 0 + 0 + 0 - 5 \frac{V_6^2}{2g} + 80 - 12 \frac{V_4^2}{2g} &= 10 + 0 + \frac{V_3^2}{2g} \end{aligned}$$

Express all velocities in terms of V_3 :

$$-\frac{5(0.25V_3)^2}{2g} + 80 - 12 \frac{(0.563V_3)^2}{2g} = 10 + \frac{V_3^2}{2g}$$

$$V_3 = 29.7 \text{ fps}$$

$$Q = A_3 V_3 = \frac{\pi}{4} \left(\frac{3}{12}\right)^2 29.7 = 1.45 \text{ cfs}$$

4.15 Method of Solution of Flow Problems 109

Head loss in suction pipe:

$$h_L = 5 \frac{V_3^2}{2g} = \frac{5(0.25V_3)^2}{2g} = \frac{0.312V_3^2}{2g}$$

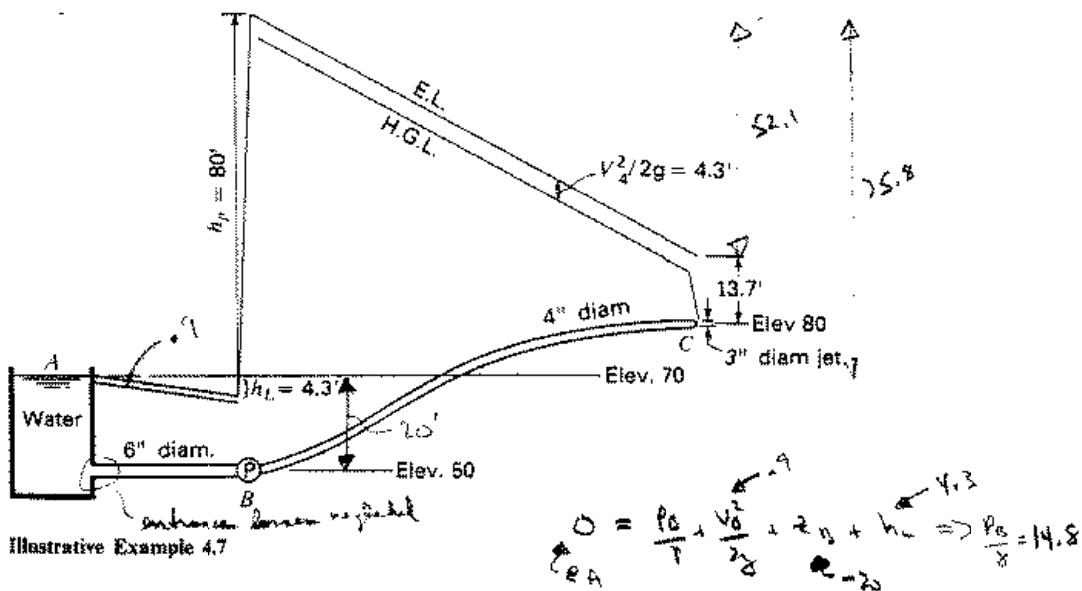

$$= 4.3 \text{ ft}$$

Head loss in discharge pipe:

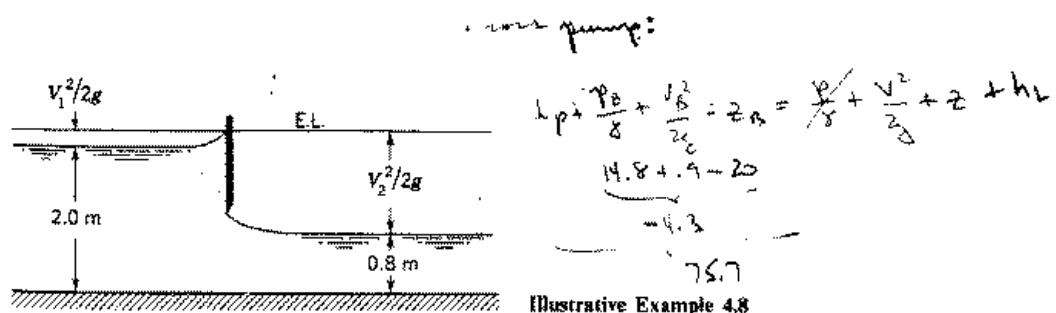

$$h_L = 12 \frac{V_3^2}{2g} = \frac{12(0.563V_3)^2}{2g} = 52.1 \text{ ft}$$

$$\frac{V_3^2}{2g} = 13.7 \text{ ft} \quad \frac{V_4^2}{2g} = 4.3 \text{ ft} \quad \frac{V_5^2}{2g} = 0.86 \text{ ft} \approx 0.9 \text{ ft}$$

The energy line and hydraulic grade line are drawn on the figure to scale. Inspection of the figure shows that the pressure head on the suction side of the pump is $\rho_B/\gamma = 14.8$ ft. Likewise, the pressure head at any point in the pipe may be found if the figure is to scale.

Illustrative Example 4.8 Given the two-dimensional flow as shown in the accompanying figure. Determine the flow rate. Assume no head loss.

Application of the Energy, Momentum, and Continuity Equations in Combination

In general, when solving fluid mechanics problems, one should use all available equations in order to derive as much information as possible about the flow. For example, consistent with the approximation of the energy equation we can also apply the momentum and continuity equations

Energy:

$$\frac{p_1}{\gamma} + \alpha_1 \frac{V_1^2}{2g} + z_1 + h_p = \frac{p_2}{\gamma} + \alpha_2 \frac{V_2^2}{2g} + z_2 + h_t + h_L$$

Momentum:

$$\sum F_s = \rho V_2^2 A_2 - \rho V_1^2 A_1 = \rho Q(V_2 - V_1)$$

Continuity:

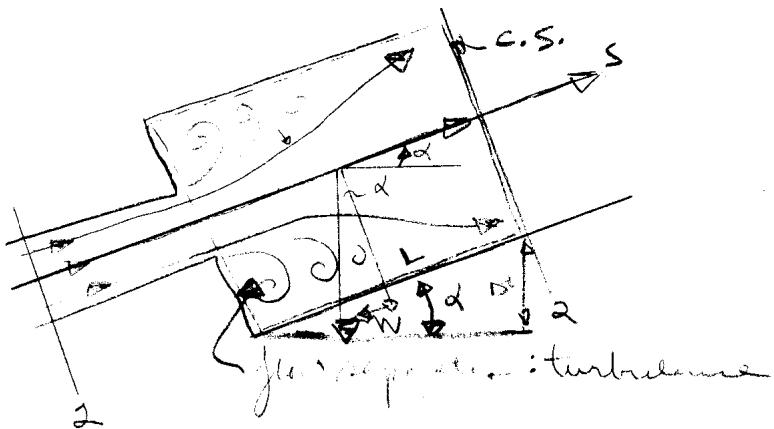

$$A_1 V_1 = A_2 V_2 = Q = \text{constant}$$

} one inlet and
one outlet
 $\rho = \text{constant}$

Abrupt Expansion

Consider the flow from a small pipe to a larger pipe. Would like to know $h_L = h_L(V_1, V_2)$. Analytic solution to exact problem is

extremely difficult due to the occurrence of flow separations and turbulence. However, if the assumption is made that the pressure in the separation region remains approximately constant and at the value at the point of separation, i.e., p_1 , an approximate solution for h_L is possible:

separation, i.e., p_1 , an approximate solution for h_L is possible:

Apply Energy Eq from 1-2 ($\alpha_1 = \alpha_2 = 1$)

$$\frac{p_1}{\gamma} + z_1 + \frac{V_1^2}{2g} = \frac{p_2}{\gamma} + z_2 + \frac{V_2^2}{2g} + h_L$$

Momentum eq. For CV shown (shear stress neglected)

$$\begin{aligned} \sum F_s &= p_1 A_2 - p_2 A_2 - \underbrace{W \sin \alpha}_{\gamma A_2 L \frac{\Delta z}{L}} = \sum \rho u \underline{V} \cdot \underline{A} \\ &= \rho V_1 (-V_1 A_1) + \rho V_2 (V_2 A_2) \\ &= \rho V_2^2 A_2 - \rho V_1^2 A_1 \end{aligned}$$

next divide momentum equation by γA_2

$$\div \gamma A_2 \underbrace{\frac{p_1}{\gamma} - \frac{p_2}{\gamma} - (z_1 - z_2)}_{=} = \frac{V_2^2}{g} - \frac{V_1^2}{g} \frac{A_1}{A_2} = \frac{V_1^2}{g} \frac{A_1}{A_2} \left(\frac{A_1}{A_2} - 1 \right)$$

from energy equation

$$\downarrow$$

$$\frac{V_2^2}{2g} - \frac{V_1^2}{2g} + h_L = \frac{V_2^2}{g} - \frac{V_1^2}{g} \frac{A_1}{A_2}$$

$$h_L = \frac{V_2^2}{2g} + \frac{V_1^2}{2g} \left(1 - \frac{2A_1}{A_2} \right)$$

$$h_L = \frac{1}{2g} \left[V_2^2 + V_1^2 - 2V_1^2 \underbrace{\frac{A_1}{A_2}}_{-2V_1V_2} \right] \quad \left. \begin{array}{l} \text{continuity eq.} \\ V_1A_1 = V_2A_2 \\ \frac{A_1}{A_2} = \frac{V_2}{V_1} \end{array} \right\}$$

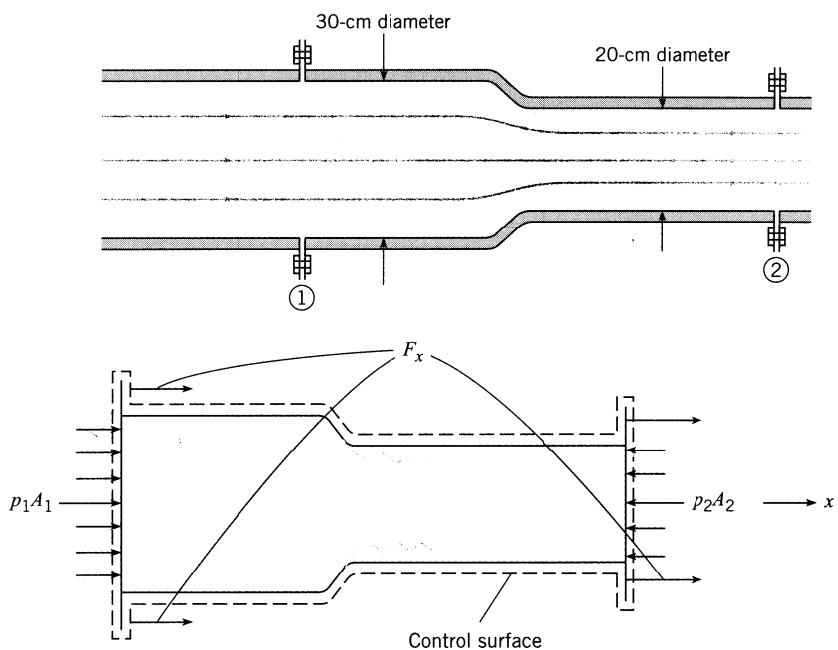

$$h_L = \frac{1}{2g} [V_2 - V_1]^2$$

If $V_2 \ll V_1$,

$$h_L = \frac{1}{2g} V_1^2$$

Forces on Transitions

Example 7-6

$$Q = .707 \text{ m}^3/\text{s}$$

$$\text{head loss} = .1 \frac{V_2^2}{2g}$$

(empirical equation)

Fluid = water

$p_1 = 250 \text{ kPa}$

$D_1 = 30 \text{ cm}$

$D_2 = 20 \text{ cm}$

$F_x = ?$

First apply momentum theorem

$$\sum F_x = \sum \rho u \underline{V} \cdot \underline{A}$$

$$F_x + p_1 A_1 - p_2 A_2 = \rho V_1 (-V_1 A_1) + \rho V_2 (V_2 A_2)$$

$$F_x = \rho Q (V_2 - V_1) - p_1 A_1 + p_2 A_2$$

force required to hold transition in place

The only unknown in this equation is p_2 , which can be obtained from the energy equation.

$$\frac{p_1}{\gamma} + \frac{V_1^2}{2g} = \frac{p_2}{\gamma} + \frac{V_2^2}{2g} + h_L \quad \text{note: } z_1 = z_2 \text{ and } \alpha = 1$$

$$p_2 = p_1 - \gamma \left[\frac{V_2^2}{2g} - \frac{V_1^2}{2g} + h_L \right] \quad \text{drop in pressure}$$

$$\Rightarrow F_x = \rho Q(V_2 - V_1) + A_2 \underbrace{\left[p_1 - \gamma \left(\frac{V_2^2}{2g} - \frac{V_1^2}{2g} + h_L \right) \right]}_{p_2} - p_1 A_1$$

(note: if $p_2 = 0$ same as nozzle)

In this equation,

$$\begin{aligned} V_1 &= Q/A_1 = 10 \text{ m/s} \\ V_2 &= Q/A_2 = 22.5 \text{ m/s} \\ h_L &= .1 \frac{V_2^2}{2g} = 2.58 \text{ m} \end{aligned}$$

continuity $A_1 V_1 = A_2 V_2$

$$V_2 = \frac{A_1}{A_2} V_1$$

i.e. $V_2 > V_1$

$$F_x = -8.15 \text{ kN} \quad \text{is negative x direction to hold transition in place}$$
