8.26

8.26 As shown in Video V8.3 and Fig. P8.26, the velocity profile for laminar flow in a pipe is quite different from that for turbulent flow. With laminar flow the velocity profile is parabolic; with turbulent flow at Re = 10,000 the velocity profile can be approximated by the power-law profile shown in the figure. (a) For laminar flow, determine at what radial loaction you would place a Pitot tube if it is to measure the average velocity in the pipe. (b) Repeat part (a) for turbulent flow with Re = 10,000.

■ FIGURE P8.26

For laminar or turbulent flow,

$$Q = AV = \pi R^2 V = \int U dA = \int U (2\pi r dr) = 2\pi \int U r dr$$

a) Laminar flow:

$$\pi R^{2}V = 2\pi V_{c} \int_{c}^{R} \left[1 - \left(\frac{r}{R}\right)^{2}\right] dr = 2\pi V_{c} \left[\frac{R^{2}}{2} - \frac{R^{2}}{4}\right] = \pi \frac{R^{2}}{2}V_{c}$$
Thus, $V = \frac{1}{2}V_{c}$ For $u = V = \frac{V_{c}}{2}$ the equation for $\frac{U}{V_{c}}$ gives $\frac{U}{V_{c}} = \frac{1}{2} = 1 - \left(\frac{r}{R}\right)^{2}$, or $\left(\frac{r}{R}\right)^{2} = \frac{1}{2}$ Thus, $r = \frac{1}{\sqrt{2}}R = 0.707R$

b) Turbulent flow
$$R$$

$$\pi R^{2}V = 2\pi V_{c} \int r[1-\frac{1}{R}]^{\frac{1}{5}} dr = 2\pi R^{2}V_{c} \int (\frac{1}{R})[1-(\frac{1}{R})]^{\frac{1}{5}} d(\frac{1}{R})$$

Let $y = 1 - (\frac{1}{R})$ so that $(\frac{1}{R}) = 1 - y$ and $d(\frac{1}{R}) = -dy$

Thus,

$$\pi R^{2}V = 2\pi R^{2}V_{c} \int (1-y)y^{\frac{1}{5}} (-dy) = 2\pi R^{2}V_{c} \int (y^{\frac{1}{5}} - y^{\frac{6}{5}}) dy$$

$$= 2\pi R^{2}V_{c} \left[\frac{1}{6} - \frac{1}{7}\right] = 2\pi R^{2}V_{c} \left(\frac{25}{66}\right)$$

or $V = \frac{50}{66}V_{c}$ For $U = V = \frac{50}{60}$ the equation for $\frac{U}{V_{c}}$ gives

$$\frac{U}{V_{c}} = \frac{50}{66} = \left[1 - \frac{1}{R}\right]^{\frac{1}{5}}$$

or $\frac{r}{R} = 0.750$ so that $r = 0.750$ R
