

## Dual ascent example

### Lagrangian Dual of SCP

(Solved via dual ascent)

```
Set(s) 23 24 25 removed from problem
(P= 16 17 22 > 14 = incumbent!)
# sets remaining is 22
```

### Iteration # 1

Current multipliers:

i	1	2	3	4	5	6	7	8
w[ii]	0	0	0	0	0	0	0	0

Solving Lagrangian relaxation:

```
*** Dual value is 0 ***
Sets in cover: #
Points not covered: 1 2 3 4 5 6 7 8
```

```
Heuristic solution cost is 12
*** New incumbent! *** Cover is 2 4 7
with cost 12
```

**Dual ascent step**

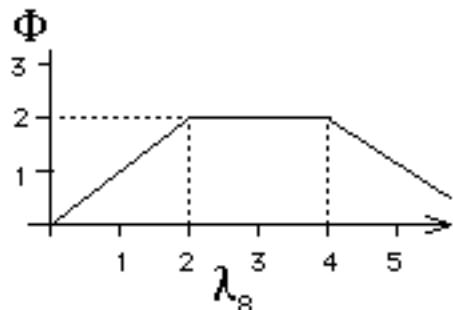

indicates that point 8 is not now covered.. its multiplier is too small

Selecting multiplier  $w[8] = 0$  with subgradient = 1  
 Sets not in solution which cover #8 are:

1 6 7 10 13 14 18 20 21 22

$X[1]$  enters when  $w[8]$  is 2  
 $X[6]$  enters when  $w[8]$  is 4

Updated  $w[8] = 2 = \text{Max}\{0, (1-\alpha) \times 2 + \alpha \times 4\}$  where  $\alpha = 0$   
 Anticipated improvement: 2

Point #8 is arbitrarily selected as one of the uncovered points. Its multiplier should be increased to provide incentive for a set to cover it.

**Iteration # 2**

Current multipliers:

i	1	2	3	4	5	6	7	8
w[i]	0	0	0	0	0	0	0	2

Solving Lagrangian relaxation:

\*\*\* Dual value is 2 \*\*\*

Sets in cover: # 1

Points not covered: 1 3 4 5 6 7

Set(s) 16 17 19 22 removed from problem

(P= 13 13 14 14 > 12 = incumbent!)

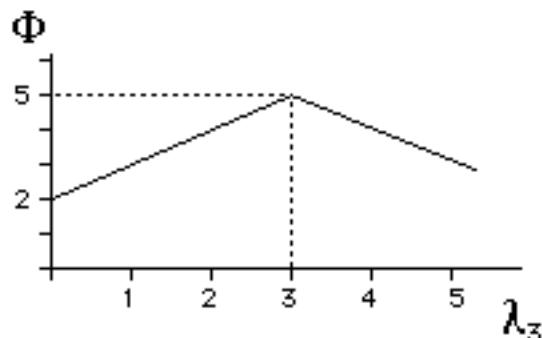

# sets remaining is 18

**Dual ascent step**

Selecting multiplier  $w[3] = 0$  with subgradient = 1  
 Sets not in solution which cover #3 are: 2 3 4 7 14

$X[2]$  enters when  $w[3]$  is 3  
 $X[3]$  enters when  $w[3]$  is 3

Updated  $w[3] = 3 = \max\{0, (1-\alpha) \times 3 + \alpha \times 3\}$  where  $\alpha = 0$   
 Anticipated improvement: 3

©D.L.Bricker, U. of IA, 1998

**Iteration # 3**

Current multipliers:

i	1	2	3	4	5	6	7	8
w[i]	0	0	3	0	0	0	0	2

Solving Lagrangian relaxation:

\*\*\* Dual value is 5 \*\*\* (Improvement: 3)

Sets in cover: # 1 2  
 Points not covered: 5 6

Set(s) 18 20 21 removed from problem  
 (P = 14 15 15 > 12 = incumbent!)  
 # sets remaining is 15

©D.L.Bricker, U. of IA, 1998

**Dual ascent step**

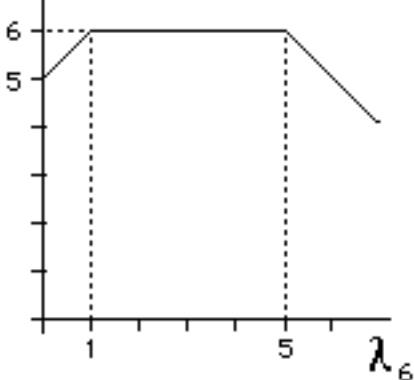

Selecting multiplier  $w[6] = 0$  with subgradient = 1

Sets not in solution which cover #6 are: 4 8 13 15

$X[4]$  enters when  $w[6]$  is 1

$X[8]$  enters when  $w[6]$  is 5

Updated  $w[6] = 1 = \max\{0, (1-\alpha) \times 1 + \alpha \times 5\}$  where  $\alpha = 0$   
Anticipated improvement: 1

 $\Phi$

**Iteration # 4**

Current multipliers:

i	1	2	3	4	5	6	7	8
w[i]	0	0	3	0	0	1	0	2

Solving Lagrangian relaxation:

\*\*\* Dual value is 6 \*\*\* (Improvement: 1)

Sets in cover: # 1 2 4

Points not covered: 5
