

# Notes on Formulation of Optimization Problems

Mark S. Daskin

Dept. of IE/MS

Northwestern University

January, 2001

8/27/2003

Formulation Rules, M. S. Daskin

1

## Outline

- Conventions
- Formulation Rules
- Typical Constraint Forms
- Core Models

8/27/2003

Formulation Rules, M. S. Daskin

2

## Conventions I (generally) Use

### ■ INDICES

- ↗ letters like i, j, k, (middle of alphabet)
- ↗ used as subscripts
- ↗ index items in sets with corresponding upper case letter (e.g, I, J, K)

### ■ INPUTS

- ↗ lower case letters near beginning of alphabet

### ■ DECISION VARIABLES

- ↗ upper case letters near end of alphabet

8/27/2003

Formulation Rules, M. S. Daskin

3

## Indices, Inputs and Dec. Var

### ■ INDICES

- ↗ used for enumerating items (e.g., demand nodes, candidate sites, scenarios, time periods)

### ■ INPUTS

- ↗ you **know** these before you start the problem or can readily compute them from other inputs
- ↗ demand values, distances, costs, probabilities, coverage distance, indicators of whether nodes are covered by others, number of sites to locate

8/27/2003

Formulation Rules, M. S. Daskin

4

## Indices, Inputs, and Dec. Var.

### ■ DECISION VARIABLES

- ↗ these are what you want to know or what you must determine **within** the model along the way to determining what you really want to know
- ↗ locations of facilities, whether a node is covered, assignment of demand nodes to facilities, maximum distance

8/27/2003

Formulation Rules, M. S. Daskin

5

## Objective function

### ■ OBJECTIVE FUNCTION

- ↗ this is what you want to minimize or maximize
- ↗ may be a single decision variable (e.g.,  $W$  for maximum distance between a node and the facility serving it as in P-center)
- ↗ more often will be a function of decision variables (e.g., the total number of facilities as in set covering, the total demand weighted distance as in P-median)

8/27/2003

Formulation Rules, M. S. Daskin

6

## Formulation rules

- Daskin's 10 (or 11) rules of formulation

8/27/2003

Formulation Rules, M. S. Daskin

7

### Rule 1

- Clearly define all subscripts (at least in your own mind) and sets. For example:

- I: set of demand nodes indexed by  $i$
- J: set of candidate sites indexed by  $j$
- K: set of scenarios indexed by  $k$
- T: set of time periods indexed by  $t$

8/27/2003

Formulation Rules, M. S. Daskin

8

### Rule 2

- Clearly separate the definitions of
  - indices and sets
  - inputs (or parameters)
  - decision variables

8/27/2003

Formulation Rules, M. S. Daskin

9

### Rule 3

- In defining inputs or decision variables in words, if an index appears in the input or decision variable it should appear in the verbal definition as well

$d_{ij}$  = distance between demand node  $i$  and candidate site  $j$

This one (above) is fine

$d_{ij}$  = distance

This one (above) is BAD

8/27/2003

Formulation Rules, M. S. Daskin

10

### Rule 4

- Do not leave dangling subscripts in the objective function

$$\text{minimize } \sum_{i \in I} \sum_{j \in J} h_i d_{ij} Y_{ij} \text{ Fine}$$

$$\text{minimize } \sum_{i \in I} c_{ij} X_{ij} \text{ BAD; } j \text{ index is dangling}$$

8/27/2003

Formulation Rules, M. S. Daskin

11

### Rule 5

- At least some decision variable must appear in the objective function and in each constraint

$$\text{minimize } \sum_{i \in I} \sum_{j \in J} h_i d_{ij} Y_{ij} \text{ Fine}$$

$$\text{subject to } d_{ij} \geq 0$$

**BAD if  $d_{ij}$  is an input distance. No decision variable here**

8/27/2003

Formulation Rules, M. S. Daskin

12

## Rule 6

- Be sure all variables are linked in some way to each other (otherwise the problem is separable and you probably have an error)

8/27/2003

Formulation Rules, M. S. Daskin

13

## Rule 6 example

$$\begin{array}{ll} \text{maximize} & \sum_{i \in I} h_i Z_i \\ \text{subject to} & \sum_{j \in J} X_j = P \\ & Z_i \in \{0,1\} & \forall i \in I \\ & X_j \in \{0,1\} & \forall j \in J \end{array}$$

**X and Z variables are unlinked. You need an additional constraint. e.g.,**

$$Z_i - \sum_j a_{ij} X_j \leq 0 \quad \forall i \in I$$

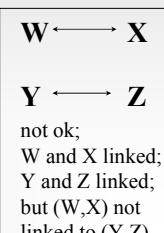

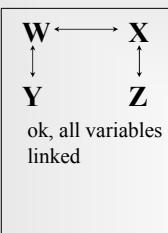

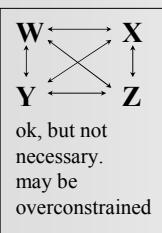

8/27/2003

Formulation Rules, M. S. Daskin

14

## More on Rule 6

- Each variable does not have to be directly linked to each other variable

8/27/2003

Formulation Rules, M. S. Daskin

15

## Rule 7

- If a variable or constant used in a constraint includes some index, then either
  - you should be summing over the index OR
  - you should specify the values of the index to which the constraint applies
  - DO NOT DO BOTH in the same constraint**

8/27/2003

Formulation Rules, M. S. Daskin

16

## Rule 7 examples

$$\sum_{j \in J} Y_{ij} = 1 \quad \forall i \in I \quad \text{Ok}$$

$$\sum_{j \in J} h_{ik} d_{ijk} Y_{ijk} \leq D \quad \forall i \in I \quad \text{BAD; Need to specify what is going on with index } k$$

$$\sum_{j \in J} Y_{ij} = 1 \quad \forall j \in J \quad \text{BAD; Summing over } j \text{ and specifying constraint applies to all } j; \text{ Also, what is going on with index } i?$$

8/27/2003

Formulation Rules, M. S. Daskin

17

## Rule 8

- Try to keep it linear (**IF POSSIBLE**)
  - avoid multiplying decision variables in the objective function or in constraints
  - avoid raising a decision variable to some power
  - avoid logs, trig functions, ....
  - be creative in transformations

8/27/2003

Formulation Rules, M. S. Daskin

18

## Rule 9

### ■ Avoid big M type constraints (IF POSSIBLE)

- ↗ constraints with a big value of some constant multiplied by a binary variable
- ↗ often used to turn on or off a constraint depending on the value of the variable
- ↗ may be unavoidable (e.g.,  $\alpha$ -reliable minimax regret formulation)

8/27/2003

Formulation Rules, M. S. Daskin

19

## Rule 10

### ■ Disaggregate constraints when possible

$$Y_{ij} \leq X_j \quad \forall i \in I, \forall j \in J \quad \text{Good, disaggregate constraint}$$

$$\sum_{i \in I} Y_{ij} \leq |I| X_j \quad \forall j \in J \quad \text{Not so good, aggregate constraint. Will lead to weaker LP relaxations}$$

8/27/2003

Formulation Rules, M. S. Daskin

20

## Rule 11

### ■ Know which of rules 1-10 can be bent and when and how to do so

8/27/2003

Formulation Rules, M. S. Daskin

21

## Typical Constraint Forms

### ■ TOTAL CONSTRAINT

$$\sum_{j \in J} X_j = p \quad \bullet \text{ the total of all the } X_j \text{ variables must be } p$$

- e.g., Pick  $p$  of the  $X_j$  variables and set them to 1, set all others to 0 (for  $X_j$  a binary variable)

8/27/2003

Formulation Rules, M. S. Daskin

22

## Typical Constraint Forms

### ■ SELECTION or ASSIGNMENT CONSTRAINT

$$\sum_{j \in J} Y_{ij} = 1 \quad \forall i \in I$$

- For each row  $i$  (e.g., each demand node), the total of the  $Y_{ij}$  variables (for that  $i$ ) must be 1
- each node  $i$  must be assigned to exactly one facility node

8/27/2003

Formulation Rules, M. S. Daskin

23

## Typical Constraint Forms

### ■ SELECTION or ASSIGNMENT CONSTRAINT

$$\sum_{k \in K_j} X_{jk} \leq 1 \quad \forall j \in J$$

- pick at most one capacity for each site  $j$  (where  $K_j$  is a set of available capacities at candidate site  $j$ )

8/27/2003

Formulation Rules, M. S. Daskin

24

## Typical Constraint Forms

### SUPPLY Constraints

$$\sum_{j \in J} X_{ij} \leq S_i \quad \forall i \in I$$

where  
 $X_{ij}$  = flow from i to j

- The total flow out of node  $i$  must be less than or equal to the supply at node  $i$  ( $S_i$ )
- Note the definition of  $X_{ij}$  and that  $i$  is being used as a supply node and  $j$  is being used as a demand node**

8/27/2003

Formulation Rules, M. S. Daskin

25

## Typical Constraint Forms

### DEMAND Constraints

$$\sum_{i \in I} X_{ij} \geq D_j \quad \forall j \in J$$

where  
 $X_{ij}$  = flow from i to j

- The total flow into node  $j$  must be greater than or equal to the demand at node  $j$  ( $D_j$ )
- Note the definition of  $X_{ij}$  and that  $i$  is being used as a supply node and  $j$  is being used as a demand node**

8/27/2003

Formulation Rules, M. S. Daskin

26

## Typical Constraint Forms

### DEMAND-LIKE Constraints

$$\sum_{k \in K} q_k Z_k \geq \alpha$$

- Total probability of selected scenarios must be at least  $\alpha$  where  $K$  is a set of scenarios
- Used in  $\alpha$ -reliable minimax regret model

8/27/2003

Formulation Rules, M. S. Daskin

27

## Typical Constraint Forms

### LINKAGE or FORCING CONSTRAINTS

$$Y_{ij} \leq X_j$$

- $X_j$  must be at least as large as  $Y_{ij}$  OR
- $Y_{ij}$  must be no bigger than  $X_j$  for each pair of  $i$  and  $j$
- You cannot assign demands at  $i$  to a facility at  $j$  ( $Y_{ij}=1$ ) unless you locate at  $j$  ( $X_j=1$ )

8/27/2003

Formulation Rules, M. S. Daskin

28

## Typical Constraint Forms

### LINKAGE or FORCING CONSTRAINTS

$$Z_i - \sum_{j \in J} a_{ij} X_j \leq 0 \quad \forall i \in I$$

- Node  $i$  cannot be counted as being covered ( $Z_i=1$ ) unless there is at least one facility that is located that is capable of covering node  $i$  ( $\sum_{j \in J} a_{ij} X_j \geq 1$ )

8/27/2003

Formulation Rules, M. S. Daskin

29

## Typical Constraint Forms

### LARGEST OF Constraints

$$W \geq \sum_{j \in J} d_{ij} Y_{ij}$$

- $W$  must be larger than the largest value of  $\sum_{j \in J} d_{ij} Y_{ij}$
- Typically  $\sum_{j \in J} d_{ij} Y_{ij}$  would represent the distance between node  $i$  and the facility to which it is assigned
- Used in P-center problems in which we minimize  $W$  subject to this and other constraints

8/27/2003

Formulation Rules, M. S. Daskin

30

## Typical Constraint Forms

### ■ CONSTRAINTS THAT SWITCH ON and OFF

$$R \geq V_k - \hat{V}_k - M(1 - Z_k) \quad \forall k \in K$$

where

$M$  = a very large number  
so

if  $Z_k = 1$  then  $R \geq V_k - \hat{V}_k$   
but if  $Z_k = 0$  then  $R \geq V_k - \hat{V}_k - M$   
and constraint is "inactive"

8/27/2003

Formulation Rules, M. S. Daskin

31

## Typical Constraint Forms

### ■ CONSTRAINTS THAT SWITCH ON and OFF

- If  $Z_k=1$  then constraint is active, otherwise it is "inactive"
- Used in  $\alpha$ -reliable minimax regret model
- Note that in this case, the remainder of the constraint (without the term in  $M$ ) is a LARGEST OF constraint
- Try to avoid big-M constraints (see rule 9)

8/27/2003

Formulation Rules, M. S. Daskin

32

## Typical Constraint Forms

### ■ DISTANCE Definition

$$\text{minimize} \quad \sum_{i \in I} \sum_{j \in J} h_{ij} (x_{ij}^+ + x_{ij}^-)$$

$$\text{subject to} \quad x_j - x_i = x_{ij}^+ - x_{ij}^- \quad \forall i \in I, \forall j \in J$$

$$x_{ij}^+, x_{ij}^- \geq 0 \quad \forall i \in I, \forall j \in J$$

where

$x_j, x_i$  = x coordinates of points j and i

$x_{ij}^+, x_{ij}^-$  = positive and negative components of the distance between i and j

8/27/2003

Formulation Rules, M. S. Daskin

33

## Typical Constraint Forms

### ■ DISTANCE Definition

- Note definitions of decision variables (different from normal)
- Used in some layout formulations
- Note interaction between objective function and constraints is critical
- example:

$$x_j = 3; x_i = 7$$

$$x_{ij}^+ = 0; x_{ij}^- = 4$$

8/27/2003

Formulation Rules, M. S. Daskin

34

## Set Covering Model

$$\text{minimize} \quad \sum_{j \in J} X_j$$

NUMBER SELECTED

subject to

$$\sum_{j \in J} a_{ij} X_j \geq 1 \quad \forall i \in I$$

DEMAND - LIKE constraint

$X_j \in \{0,1\}$

$\forall j \in J$

INTEGRALITY

8/27/2003

Formulation Rules, M. S. Daskin

35

## Maximal Covering Model

$$\text{maximize} \quad \sum_{i \in I} h_i Y_i$$

Number Covered

subject to

$$\sum_{j \in J} a_{ij} X_j \geq Y_i \quad \forall i \in I$$

Coverage Constraint (linkage)

$\sum_{j \in J} X_j = p$

Number to Locate

$X_j \in \{0,1\}$

$\forall j \in J$

$Y_i \in \{0,1\}$

$\forall i \in I$

Integrality

8/27/2003

Formulation Rules, M. S. Daskin

36

## P-median Model

$$\begin{aligned}
 \text{minimize} \quad & \sum_{i \in I} \sum_{j \in J} h_i d_{ij} Y_{ij} && \text{Demand Wtd Total Dist} \\
 \text{subject to} \quad & \sum_{j \in J} Y_{ij} = 1 \quad \forall i \in I && \text{ASSIGNMENT} \\
 & \sum_{j \in J} X_j = p && \text{constraint} \\
 & Y_{ij} - X_j \leq 0 \quad \forall i \in I, \forall j \in J && \text{LINKAGE} \\
 & X_j \in \{0,1\} \quad \forall j \in J && \text{constraint} \\
 & Y_{ij} \in \{0,1\} \quad \forall i \in I, \forall j \in J && \text{INTEGRALITY}
 \end{aligned}$$

8/27/2003

Formulation Rules, M. S. Daskin

37

## Fixed Charge Loc. Model

$$\begin{aligned}
 \text{minimize} \quad & \sum_{j \in J} f_j X_j + \beta \sum_{i \in I} \sum_{j \in J} h_i d_{ij} Y_{ij} && \text{Fixed +} \\
 & \sum_{j \in J} Y_{ij} = 1 \quad \forall i \in I && \text{Transport Cost} \\
 \text{subject to} \quad & \sum_{j \in J} X_j = p && \text{ASSIGNMENT} \\
 & Y_{ij} - X_j \leq 0 \quad \forall i \in I, \forall j \in J && \text{constraint} \\
 & X_j \in \{0,1\} \quad \forall j \in J && \text{LINKAGE} \\
 & Y_{ij} \in \{0,1\} \quad \forall i \in I, \forall j \in J && \text{constraint} \\
 & Y_{ij} \in \{0,1\} \quad \forall i \in I, \forall j \in J && \text{INTEGRALITY}
 \end{aligned}$$

8/27/2003

Formulation Rules, M. S. Daskin

38

## P-center Model

$$\begin{aligned}
 \text{minimize} \quad & W && \text{Maximum Distance} \\
 \text{subject to} \quad & \sum_{j \in J} Y_{ij} = 1 \quad \forall i \in I && \text{ASSIGNMENT constraint} \\
 & \sum_{j \in J} X_j = p && \text{TOTAL constraint} \\
 & Y_{ij} - X_j \leq 0 \quad \forall i \in I, \forall j \in J && \text{LINKAGE} \\
 & W \geq \sum_{j \in J} d_{ij} Y_{ij} \quad \forall i \in I && \text{constraint} \\
 & X_j \in \{0,1\} \quad \forall j \in J && \text{MAXIMUM} \\
 & Y_{ij} \in \{0,1\} \quad \forall i \in I, \forall j \in J && \text{constraint} \\
 & Y_{ij} \in \{0,1\} \quad \forall i \in I, \forall j \in J && \text{INTEGRALITY}
 \end{aligned}$$

8/27/2003

Formulation Rules, M. S. Daskin

39
