

Undesirable Properties of GP Dual:

- objective function is nondifferentiable if $\delta_i = 0 \& \lambda_k = 0$ for any i & k
- if $\lambda_k = 0$, then $\delta_i = 0 \ \forall \ i \in [k]$
- it is possible that the dual solution does not provide sufficient information to compute the optimal primal solution.
- for small δ_i , computation of the terms $\delta_i \ln \delta_i$ introduce substantial numerical errors.

©Dennis Bricker, U. of Iowa, 1998

Define functions

$$\begin{split} G_k(\rho) &\equiv \sum\limits_{j \in [k]} \left\{ \; \rho_j \; ln \; c_j - \rho_j \; ln \; \rho_j \right\} & \qquad \textit{entropy} \\ A_{ki}(\rho) &\equiv \; \sum\limits_{j \in [k]} a_{ij} \; \rho_j \end{split}$$

©Dennis Bricker, U. of Iowa, 1998

For fixed values of λ , this is an entropy problem...

For fixed values of ρ , this is an LP problem.

$$\begin{aligned} \text{Max & ln } \mathbf{v}(\delta, \lambda) &= \sum_{i=1}^{N} \left\{ \delta_{i} \text{ ln } \mathbf{c}_{i} - \delta_{i} \text{ ln } \delta_{i} \right\} + \sum_{k=0}^{K} \lambda_{k} \text{ ln } \lambda_{k} \\ \text{subject to} \\ & \sum_{i \in [k]} \delta_{i} = \lambda_{k} \text{ , } k = 0, 1, \cdots K \\ & \sum_{i = [k]}^{N} a_{ij} \delta_{i} = 0, \text{ } j = 1, \cdots M \\ & \text{Orthogonality} \\ \lambda_{0} &= 1 \\ & \delta_{i} \geq 0, \lambda_{k} \geq 0 \end{aligned}$$

©Dennis Bricker, U. of Iowa, 1998

Make a change of variable:

$$\delta_j = \rho_j \lambda_k \text{ for } j \in [k]$$
 so that
$$\rho_j = \frac{\delta_j}{\lambda_k} \text{ if } j \in [k] \& \lambda_k > 0$$

Note that

GP

$$\textstyle\sum\limits_{i\in[k]}\delta_i=\lambda_k\;\;\Longrightarrow\;\;\textstyle\sum\limits_{j\in[k]}\;\rho_j=1\quad\forall\,k$$

©Dennis Bricker, U. of Iowa, 1998

Maximize
$$\sum\limits_{k=0}^{P} \, G_k(\rho) \, \lambda_k$$

subject to

$$\begin{array}{c} \sum\limits_{k=0}^{P} \; A_{k\,i}(\rho)\, \lambda_{k} = 0,\, i\!=\!1,\ldots N \\ \\ \lambda_{0} = 1 \end{array} \label{eq:lambda_k_i}$$

$$\begin{aligned} &\sum_{j \in [k]} \; \rho_j = 1, \; k{=}0,1, \dots K \\ &\lambda_k \geq 0, \; \rho_j \geq 0, \; \; \forall k,j \end{aligned}$$

©Dennis Bricker, U. of Iowa, 1998

That is, $\begin{array}{c|c} \text{Maximize} & \sum\limits_{k=0}^p \gamma_k \lambda_k \\ \text{subject to} & \sum\limits_{k=0}^p \alpha_{kj} \lambda_k = 0, j{=}1, \dots m \\ \\ \hline \\ \textit{Linear} \\ \textit{Program} \\ \textit{in } \lambda & \\ \hline \\ (\gamma_k, \alpha_k) \in S_k \,, \, k{=}0, \dots p \\ \end{array}$

whore

$$S_k \, = \, \left\{ (\gamma, \alpha) | \, \exists \, \, \rho \geq 0 \, , \, \sum_{i \in [k]} \rho_i = 1 \text{ such that } \gamma = G_k(\rho), \, \alpha_j = A_{kj}(\rho) \, \right\}$$

This class of problems, which are linear programming problems in which the columns are also to be selected, was called

Generalized Linear Programs

by George Dantzig, and was used in solving chemical equilibrium problems.

©Dennis Bricker, U. of Iowa, 1998

If t is optimal in the primal, and (ρ, λ) is optimal in the dual,

then $\rho_j > 0$ and $g_k(t) > 0$

 $(\gamma_k, \alpha_k) \in S_k \Leftrightarrow$

of the set!

and

$$ho_{\mathrm{j}} = rac{\mathbf{e}_{\mathrm{j}} \prod\limits_{\mathrm{i}=1}^{\mathrm{N}} \mathbf{t}_{\mathrm{i}}^{\mathrm{a}_{\mathrm{i}\mathrm{j}}}}{\mathbf{g}_{\mathrm{k}}(\mathbf{t})}$$

whether the constraint k is tight or slack!

 $\exists \ \mu_{kn} \geq 0, \, n \in N_k$

such that

Any element of a convex set can be represented

by a convex combination of the extreme points

♦

The dual solution thereby always provides sufficient information to compute the primal solution!

©Dennis Bricker, U. of Iowa, 1998

 $\textstyle\sum_{n\in N_k}\,\mu_{kn}=1$

 $\gamma_k = \sum_{n \in \mathbb{N}_k} \mu_{kn} \hat{\gamma}_k^n$

 $\alpha_k = \sum_{n \in N_k} \mu_{kn} \hat{\alpha}_k^n$

Column-Generating Algorithm

 S_k is a convex set, and is therefore the convex hull of its set of extreme points,

$$ext(S_k) = \{(\hat{\gamma}_k^n, \hat{\alpha}_k^n)\}_{n \in N_k}$$
 For simplicity, we assume that the set of extreme points is countable!

The GLP dual may then be written

or, by defining $u_{kn} \equiv \mu_{kn} \lambda_k$

$$\label{eq:maximize} \begin{array}{ll} \text{Maximize} & \sum\limits_{k=0}^{p} \sum\limits_{n \in N_k} \widehat{\gamma}_k^n \mathbf{u}_{k\,n} \\ \text{subject to} & \sum\limits_{k=0}^{p} \sum\limits_{n \in N_k} \widehat{\alpha}_k^n \mathbf{u}_{k\,n} = 0, \, j{=}1, \cdots m \\ & \sum\limits_{n \in N_0} \mathbf{u}_{on} = 1 \end{array}$$

Step 0 For each k, select one or more extreme points of

Generate an LP with columns and variables corresponding to the sets of extreme points

Step 2 Compute the simplex multipliers of the orthogonality constraints and normality constraint.

Column-Generating ⇔⇔ Algorithm for SILP Step 3 For each k=0,1,...p, choose (γ_k, α_k) so as to maximize the relative profit:

$$\begin{array}{ll} \text{maximize} & \gamma = \sum\limits_{j=1}^m w_j \; \alpha_j \\ (\gamma, \alpha) \in \; S_k & \qquad \qquad \text{if } k \! > \! 0 \\ \end{array}$$

Column-Generating

Algorithm for SILP

Step 4

For each (γ_k, α_k) whose relative profit exceeds some tolerance, add the corresponding column to the LP tableau.

If no columns can be added, stop; else, return to Step 1

Column-Generating
Algorithm for SILP

Maximizing the Relative Profit

That is, if we compute the primal (approximate) solution $x_i = e^{w_i}$, $j=1, \dots m$

(i.e., exponentiate the simplex multipliers of the orthogonality conditions)

then

$$\rho_{n} = \frac{\mathbf{c}_{n} \prod_{j} \mathbf{x}_{j}^{a_{n,j}}}{\sum_{i \in [k]} \mathbf{c}_{i} \prod_{j} \mathbf{x}_{j}^{a_{i,j}}} = \frac{term \ n}{posynomial \ k} > 0$$

$$\forall \ n \in [k]$$

Multi-Item EOQ

EXAMPLE

Demand for three items is known, with the rate of demand constant over time, D_i/year. Holding cost of item #i is H_i /unit/year, and each replenishment incurs a cost of A_i.

Let Q_i = order quantity of item #i. D_i/Q_i = average # replenishments per year Q_i/Q_i = average inventory level $\langle \Box \Box \rangle$

Often there are additional constraints on the ordering policy, e.g.,

a limit on the number of replenishments/year

$$\sum_i \, \frac{D_i}{Q_i} \leq \, \overline{N}$$

 a limit on the maximum volume (if all orders were to arrive simultaneously)

$$\sum_i \, v_i Q_i \, \leq \, \, \overline{V}$$

• a limit on the average investment in inventory $\textstyle\sum_i \frac{1}{2} C_i Q_i \leq \overline{B}$

Maximizing the Relative Profit

For each k, the column having maximum relative profit is (γ_k, α_k) where

$$\gamma_k = G_k(\rho), \quad \alpha_k = A_{k,j}(\rho)$$
and
$$\rho_n = \frac{\mathbf{c}_n e^{\sum_{j} a_{nj} w_j}}{\sum_{i \in P_n} \mathbf{c}_i e^{\sum_{j} a_{ij} w_j}}$$

♦₽

For the ρ thus obtained, i.e.,

$$\rho_{n} = \frac{\mathbf{c}_{n} \prod_{j} x_{j}^{a_{n,j}}}{\sum_{i \in [k]} \mathbf{c}_{i} \prod_{j} x_{j}^{a_{i,j}}} \quad \forall \quad n \in [k]$$

the relative profit function is nonpositive if & only if

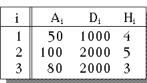

$$g_0(x) = g_0(x^*)$$

$$g_k(x) \le 1$$

$$\Leftrightarrow \Rightarrow$$

The classic EOQ ("economic order quantity") formula of Wilson specifies the order quantity which minimizes this annual cost:

$$Q_i^* = \sqrt{\frac{2A_iD_i}{H_i}}$$

EOQ

EXAMPLE

 $\begin{aligned} & \text{Minimize } \sum_{i=1}^{3} \left[\frac{A_i D_i}{Q_i} + \frac{1}{2} \; H_i \; Q_i \right] \\ & \text{subject to } \sum_{i=1}^{3} \; Q_i \leq \widehat{Q} \\ & \text{Multi-Item} \end{aligned}$
