

Occurs only if:

- 2D-PIV + image correction OR Stereo-PIV
- AND mapping function magnification 1 : 1
- AND almost constant flow (easier to see)
- AND averaging of sufficient vector fields
(single vector field: noise > bias)
- AND bilinear interpolation, maybe also for
Whittaker when small particles < 1 px

Solutions:

- a) Use 'high-accuracy mode' = Whittaker interpolation !!!
- b) Changing mapping function to unequal 1:1-magnification e.g. 1.1 : 1 (right now per macro)
- c) Other solution...
