

The Bernoulli equation:

1) In a "pressure" form

$$\underbrace{\underbrace{\widehat{p}}_{\text{static pressure}} + \underbrace{\frac{1}{2}\rho V^2}_{\text{dynamic pressure}} + \underbrace{\widehat{\gamma z}}_{\text{hydrostatic pressure}}}_{\text{Total pressure}} = \text{constant}$$

*Stagnation pressure*

2) In the "head" form:

$$\underbrace{\frac{p}{\gamma}}_{\text{pressure head}} + \underbrace{\frac{V^2}{2g}}_{\text{velocity head}} + \underbrace{z}_{\text{elevation head}} = \text{constant} = H$$

The Energy Grade Line (EGL) and the Hydraulic Grade Line (HGL): A geometrical interpretation of a flow

$$EGL \equiv \frac{p}{\gamma} + \frac{V^2}{2g} + z$$

$$HGL \equiv \frac{p}{\gamma} + z$$

Note:

- Stagnation tube: Measurement of the total head (energy) of the flow.
- Pressure tap: Measurement of the sum of the pressure head and the elevation head.

$$EGL = \frac{p}{\gamma} + \frac{V^2}{2g} + z$$

$$HGL = \frac{p}{\gamma} + z$$

Example 1:

Example 2:

$$\frac{p}{\gamma} = HGL - z$$
