

2.116

2.116 A 4-m-long curved gate is located in the side of a reservoir containing water as shown in Fig. P2.116. Determine the magnitude of the horizontal and vertical components of the force of the water on the gate. Will this force pass through point A? Explain.

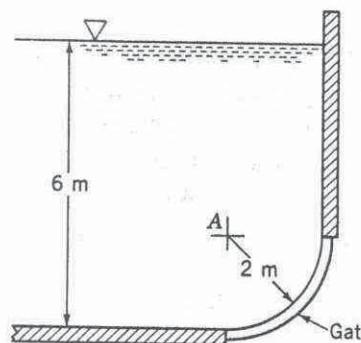

FIGURE P2.116

For equilibrium,

$$\sum F_x = 0$$

or

$$F_H = F_2 = \gamma h c_2 A_2 = \gamma (4m + 1m)(2m \times 4m)$$

so that

$$F_H = (9.80 \frac{kN}{m^3})(5m)(8m^2) = \underline{392 kN}$$

Similarly,

$$\sum F_y = 0$$

$$F_V = F_1 + q_W \quad \text{where :}$$

$$F_1 = [\gamma (4m)](2m \times 4m) = (9.80 \frac{kN}{m^3})(4m)(8m^2)$$

$$q_W = \gamma V = (9.80 \frac{kN}{m^3})(4\pi m^3)$$

Thus,

$$F_V = (9.80 \frac{kN}{m^3}) [32 m^3 + 4\pi m^3] = \underline{437 kN}$$

(Note: Force of water on gate will be opposite in direction to that shown on figure.)

The direction of all differential forces acting on the curved surface is perpendicular to surface, and therefore, the resultant must pass through the intersection of all these forces which is at point A. Yes.
