

2.82

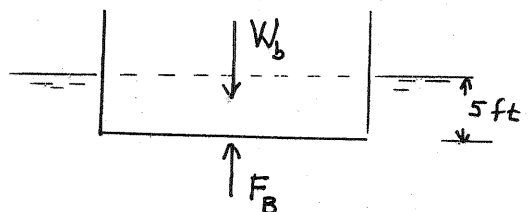

2.82 A river barge, whose cross section is approximately rectangular, carries a load of grain. The barge is 28 ft wide and 90 ft long. When unloaded its draft (depth of submergence) is 5 ft, and with the load of grain the draft is 7 ft. Determine: (a) the unloaded weight of the barge, and (b) the weight of the grain.

(a) For equilibrium,

$$\sum F_{\text{vertical}} = 0$$

so that

$$\begin{aligned} W_b &= F_B = \gamma_{H_2O} \times (\text{submerged volume}) \\ &= \left(62.4 \frac{\text{lb}}{\text{ft}^3}\right) (5 \text{ ft} \times 28 \text{ ft} \times 90 \text{ ft}) \\ &= \underline{\underline{786,000 \text{ lb}}} \end{aligned}$$

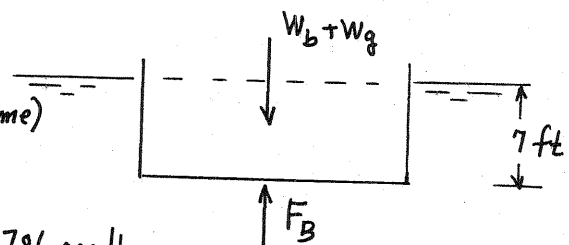

$W_b \sim$ weight of barge (unloaded)

(b) $\sum F_{\text{vertical}} = 0$

$$W_b + W_g = F_B = \gamma_{H_2O} \times (\text{submerged volume})$$

$$W_g = \left(62.4 \frac{\text{lb}}{\text{ft}^3}\right) (7 \text{ ft} \times 28 \text{ ft} \times 90 \text{ ft}) - 786,000 \text{ lb}$$

$$= \underline{\underline{315,000 \text{ lb}}}$$

$W_g \sim$ weight of grain
