2.98 A river barge, whose cross section is approximately rectangular, carries a load of grain. The barge is 28 ft wide and 90 ft long. When unloaded its draft (depth of submergence) is 5 ft, and with the load of grain the draft is 7 ft. Determine: (a) the unloaded weight of the barge, and (b) the weight of the grain.

(a) For equilibrium,

$$\sum F_{vertical} = 0$$
So that

$$W_b = F_B = \delta_{H_{20}} \times (\text{submerged volume})$$

$$= (62.4 \frac{16}{ft^3})(5 \text{ ft} \times 28 \text{ ft} \times 90 \text{ ft})$$

$$= 786,000 \text{ lb}$$
(b)
$$\sum F_{vertical} = 0$$
