## ME:5160 (58:160) Intermediate Mechanics of Fluids <br> Fall 2023 - HW8 Solution

*P5.60 The thrust $F$ of a free propeller, either aircraft or marine, depends upon density $\rho$, the rotation rate $n \mathrm{in} \mathrm{r} / \mathrm{s}$, the diameter $D$, and the forward velocity $V$. Viscous effects are slight and neglected here. Tests of a $25-\mathrm{cm}$-diameter model aircraft propeller, in a sealevel wind tunnel, yield the following thrust data at a velocity of $20 \mathrm{~m} / \mathrm{s}$ :

| Rotation rate, r/min | 4800 | 6000 | 8000 |
| :--- | :--- | :--- | :--- |
| Measured thrust, N | 6.1 | 19 | 47 |

(a) Use this data to make a crude but effective dimensionless plot. (b) Use the dimensionless data to predict the thrust, in newtons, of a similar $1.6-\mathrm{m}$-diameter prototype propeller when rotating at $3800 \mathrm{r} / \mathrm{min}$ and flying at $225 \mathrm{mi} / \mathrm{h}$ at 4000 m standard altitude.

Solution: The given function is $F=\operatorname{fcn}(\rho, n, D, V)$, and we note that $j=3$. Hence we expect 2 pi groups. The writer chose ( $\rho, n, D$ ) as repeating variables and found this:

$$
C_{F}=f c n(J), \text { where } \quad C_{F}=\frac{F}{\rho n^{2} D^{4}} \quad \text { and } \quad J=\frac{V}{n D}
$$

The quantity $C_{\mathrm{F}}$ is called the thrust coefficient, while $J$ is called the advance ratio. Now use the data (at $\rho=1.2255 \mathrm{~kg} / \mathrm{m}^{3}$ ) to fill out a new table showing the two pi groups:

| $n, \mathrm{r} / \mathrm{s}$ | 133.3 | 100.0 | 80.0 |
| :--- | :--- | :--- | :--- |
| $C_{\mathrm{F}}$ | 0.55 | 0.40 | 0.20 |
| $J$ | 0.60 | 0.80 | 1.00 |

A crude but effective plot of this data is as follows. Ans.(a)

(b) At 4000 m altitude, from Table A.6, $\rho=0.8191 \mathrm{~kg} / \mathrm{m}^{3}$. Convert $225 \mathrm{mi} / \mathrm{h}=101.6$ $\mathrm{m} / \mathrm{s}$. Convert $3800 \mathrm{r} / \mathrm{min}=63.3 \mathrm{r} / \mathrm{s}$. Then find the prototype advance ratio:

$$
J=(101.6 \mathrm{~m} / \mathrm{s}) /[(63.3 \mathrm{r} / \mathrm{s})(1.6 \mathrm{~m})]=1.00
$$

Well, lucky us, that's our third data point! Therefore $C_{\mathrm{F}, \text { prototype }} \approx 0.20$. And the thrust Is:

$$
F_{\text {prototype }}=C_{F} \rho n^{2} D^{4}=(0.20)\left(0.8191 \frac{\mathrm{~kg}}{\mathrm{~m}^{3}}\right)\left(63.3 \frac{r}{\mathrm{~s}}\right)^{2}(1.6 \mathrm{~m})^{4} \approx 4300 \mathrm{~N} \text { Ans. }(b)
$$

*P5.76 A 2-ft-long model of a ship is tested in a freshwater tow tank. The measured drag may be split into "friction" drag (Reynolds scaling) and "wave" drag (Froude scaling). The model data are as follows:

| Tow speed, ft/s: | 0.8 | 1.6 | 2.4 | 3.2 | 4.0 | 4.8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Friction drag, lbf: | 0.016 | 0.057 | 0.122 | 0.208 | 0.315 | 0.441 |
| Wave drag, lbf: | 0.002 | 0.021 | 0.083 | 0.253 | 0.509 | 0.697 |

The prototype ship is 150 ft long. Estimate its total drag when cruising at 15 kn in seawater at $20^{\circ} \mathrm{C}$.
Solution: For fresh water at $20^{\circ} \mathrm{C}$, take $\rho=1.94$ slug/ $\mathrm{ft}{ }^{3}, \mu=2.09 \mathrm{E}-5$ slug/ft.s. Then evaluate the Reynolds numbers and the Froude numbers and respective force coefficients:

| $\mathrm{Vm}, \mathrm{ft} / \mathrm{s}:$ | 0.8 | 1.6 | 2.4 | 3.2 | 4.0 | 4.8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{Rem}=\mathrm{VmLm} / \mathrm{V}:$ | 143000 | 297000 | 446000 | 594000 | 743000 | 892000 |
| $\mathrm{C}_{\mathrm{F}, \text { friction: }}:$ | 0.00322 | 0.00287 | 0.00273 | 0.00261 | 0.00254 | 0.00247 |
| $\mathrm{Frm}=\mathrm{Vm} / \sqrt{ }(\mathrm{gLm}):$ | 0.099 | 0.199 | 0.299 | 0.399 | 0.498 | 0.598 |
| $\mathrm{C}_{\mathrm{F}, \text { wave }:}$ | 0.00040 | 0.00106 | 0.00186 | 0.00318 | 0.00410 | 0.00390 |

For seawater, take $\rho=1.99$ slug/ $\mathrm{ft}^{3}, \mu=2.23 \mathrm{E}-5$ slug/ft.s. With $\mathrm{Lp}=150 \mathrm{ft}$ and $\mathrm{V}_{\mathrm{p}}=15$ knots $=25.3 \mathrm{ft} / \mathrm{s}$, evaluate

$$
\mathrm{Re}_{\text {proto }}=\frac{\rho_{\mathrm{p}} \mathrm{~V}_{\mathrm{p}} \mathrm{~L}_{\mathrm{p}}}{\mu_{\mathrm{p}}}=\frac{1.99(25.3)(150)}{2.23 \mathrm{E}-5} \approx 3.39 \mathrm{E} 8 ; \quad \mathrm{Fr}_{\mathrm{p}}=\frac{25.3}{[32.2(150)]^{1 / 2}} \approx 0.364
$$

For $\mathrm{Fr} \approx 0.364$, interpolate to $\mathrm{C}_{\mathrm{F}, \text { wave }} \approx 0.0027$
Thus we can immediately estimate Fwave $\approx 0.0027(1.99)(25.3)^{2}(150)^{2} \approx \underline{77000} \mathrm{lbf}$. However, as mentioned in Fig. 5.8 of the text, Rep is far outside the range of the friction force data, therefore we must extrapolate as best we can. A power-law curve-fit is

$$
\mathrm{C}_{\mathrm{F}, \text { friction }} \approx \frac{0.0178}{\mathrm{Re}^{0.144}}, \text { hence } \mathrm{C}_{\mathrm{F}, \text { proto }} \approx \frac{0.0178}{(3.39 \mathrm{E} 8)^{0.144}} \approx 0.00105
$$

Thus Frriction $=0.00105(1.99)(25.3)^{2}(150)^{2} \approx \underline{30000} \mathrm{lbf}$. Ftotal $\approx 107000 \mathrm{lbf}$. Ans.

$$
\begin{aligned}
& \frac{Q_{m}}{Q_{p}}=\frac{V_{m}}{V_{p}} \frac{A_{m}}{A_{p}}=\sqrt{\frac{L_{m}}{L_{p}}}\left(\frac{L_{m}}{L_{p}}\right)^{2}=\left(\frac{L_{m}}{L_{p}}\right)^{5 / 2} \text { or } \alpha^{5 / 2} \\
& \text { Fig.5/9: } \alpha=1: 65 ; \quad \therefore Q_{\text {model }}=\left(10100 \frac{f t^{3}}{s}\right)\left(\frac{1}{65}\right)^{5 / 2}=0.30 \frac{f t^{3}}{s} \text { Ans. }
\end{aligned}
$$

P6.4 For flow of SAE 30W oil through a 5-cm-diameter pipe, from Fig. A.1, for what flow rate in $\mathrm{m}^{3} / \mathrm{h}$ would we expect transition to turbulence at (a) $20^{\circ} \mathrm{C}$ and (b) $100^{\circ} \mathrm{C}$ ?

Solution: For SAE 30W oil take $\rho=891 \mathrm{~kg} / \mathrm{m}^{3}$ and take $\mu=0.29 \mathrm{~kg} / \mathrm{m} \cdot \mathrm{s}$ at $20^{\circ} \mathrm{C}$ (Table A.3) and $0.01 \mathrm{~kg} / \mathrm{m}-\mathrm{s}$ at $100^{\circ} \mathrm{C}$ (Fig A.1). Write the critical Reynolds number in terms of flow rate $Q$ :
(a) $\operatorname{Re}_{c r i t}=2300=\frac{\rho V D}{\mu}=\frac{4 \rho Q}{\pi \mu D}=\frac{4\left(891 \mathrm{~kg} / \mathrm{m}^{3}\right) Q}{\pi(0.29 \mathrm{~kg} / \mathrm{m} \cdot \mathrm{s})(0.05 \mathrm{~m})}$,
solve $Q=0.0293 \frac{m^{3}}{s}=\mathbf{1 0 6} \frac{\mathbf{m}^{3}}{\mathbf{h}}$ Ans. (a)
(b) $\operatorname{Re}_{\text {crit }}=2300=\frac{\rho V D}{\mu}=\frac{4 \rho Q}{\pi \mu D}=\frac{4\left(891 \mathrm{~kg} / \mathrm{m}^{3}\right) Q}{\pi(0.010 \mathrm{~kg} / \mathrm{m} \cdot \mathrm{s})(0.05 \mathrm{~m})}$,
solve $Q=0.00101 \frac{m^{3}}{s}=3.6 \frac{\mathbf{m}^{3}}{\mathrm{~h}}$ Ans. (b)

P6.24 Two tanks of water at $20^{\circ} \mathrm{C}$ are connected by a capillary tube 4 mm in diameter and 3.5 m long. The surface of tank 1 is 30 cm higher than the surface of tank 2 . (a) Estimate the flow rate in $\mathrm{m}^{3} / \mathrm{h}$. Is the flow laminar? (b) For what tube diameter will $\operatorname{Re} d$ be 500 ?

Solution: For water, take $\rho=998 \mathrm{~kg} / \mathrm{m}^{3}$ and $\mu=0.001 \mathrm{~kg} / \mathrm{m} \cdot \mathrm{s}$. (a) Both tank surfaces are at atmospheric pressure and have negligible velocity. The energy equation, when neglecting minor losses, reduces to:

$$
\begin{gathered}
\Delta z=0.3 m=h_{f}=\frac{128 \mu L Q}{\pi \rho g d^{4}}=\frac{128(0.001 \mathrm{~kg} / \mathrm{m} \cdot \mathrm{~s})(3.5 \mathrm{~m}) Q}{\pi\left(998 \mathrm{~kg} / \mathrm{m}^{3}\right)\left(9.81 \mathrm{~m} / \mathrm{s}^{2}\right)(0.004 \mathrm{~m})^{4}} \\
\text { Solve for } Q=5.3 E-6 \frac{\mathrm{~m}^{3}}{s}=\mathbf{0 . 0 1 9} \frac{\mathbf{m}^{3}}{\mathbf{h}} \quad \text { Ans. (a) }
\end{gathered}
$$

Check $\quad \operatorname{Re}_{\mathrm{d}}=4 \rho Q /(\pi \mu d)=4(998)(5.3 \mathrm{E}-6) /[\pi(0.001)(0.004)]$
$\mathbf{R e}_{\mathbf{d}}=1675$ laminar. Ans. (a)
(b) If Red $=500=4 \rho Q /(\pi \mu d)$ and $\Delta z=h \mathrm{f}$, we can solve for both $Q$ and $d$ :

$$
\begin{gathered}
\operatorname{Re}_{d}=500=\frac{4\left(998 \mathrm{~kg} / \mathrm{m}^{3}\right) Q}{\pi(0.001 \mathrm{~kg} / \mathrm{m} \cdot \mathrm{~s}) d}, \quad \text { or } \quad Q=0.000394 d \\
h_{f}=0.3 \mathrm{~m}=\frac{128(0.001 \mathrm{~kg} / \mathrm{m} \cdot \mathrm{~s})(3.5 \mathrm{~m}) Q}{\pi\left(998 \mathrm{~kg} / \mathrm{m}^{3}\right)\left(9.81 \mathrm{~m} / \mathrm{s}^{2}\right) d^{4}}, \quad \text { or } \quad Q=20600 \mathrm{~d}^{4}
\end{gathered}
$$

Combine these two to solve for $Q=1.05 E-6 \mathrm{~m}^{3} / \mathrm{s}$ and $\mathbf{d}=\mathbf{2 . 6 7} \mathbf{~ m m}$ Ans. (b)

P6.29 SAE 30W oil at $20^{\circ} \mathrm{C}$ flows through a straight pipe 25 m long, with diameter 4 cm . The average velocity is $2 \mathrm{~m} / \mathrm{s}$. (a) Is the flow laminar? Calculate (b) the pressure drop; and $(c)$ the power required. (d) If the pipe diameter is doubled, for the same average velocity, by what percent does the required power increase?

Solution: For SAE 30 W oil at $20^{\circ} \mathrm{C}$, Table A. $3, \rho=891 \mathrm{~kg} / \mathrm{m}^{3}$, and $\mu=0.29 \mathrm{~kg} / \mathrm{m}$-s. (a) We have enough information to calculate the Reynolds number:

$$
\operatorname{Re}_{D}=\frac{\rho V D}{\mu}=\frac{(891)(2.0)(0.04)}{0.29}=\mathbf{2 4 6}<2300 \quad \text { Yes, laminar flow Ans.(a) }
$$

$(b, c)$ The pressure drop and power follow from the laminar formulas of Eq. (6.12):

$$
\begin{aligned}
& \Delta p=\frac{32 \mu L V}{D^{2}}=\frac{32(0.29)(25)(2.0)}{(0.04)^{2}}=\mathbf{2 9 0 , 0 0 0} \mathrm{Pa} \quad \text { Ans. }(b) \\
& \qquad Q=\frac{\pi}{4} D^{2} V=\frac{\pi}{4}(0.04)^{2}(2.0)=0.00251 \frac{\mathrm{~m}^{3}}{s} \\
& \text { Power }=Q \Delta p=\left(0.00251 \frac{m^{3}}{2}\right)(290,000 \mathrm{~Pa})=729 \mathrm{~W} \quad \text { Ans. }(c)
\end{aligned}
$$

(d) If $D$ doubles to 8 cm and $V$ remains the same at $2.0 \mathrm{~m} / \mathrm{s}$, the new pressure drop will be $72,500 \mathrm{~Pa}$, and the new flow rate will be $Q=0.01005 \mathrm{~m}^{3} / \mathrm{s}$, hence the new power will be

$$
P=Q \Delta p=(0.01005)(72,500)=729 \mathrm{~W} \quad \text { Zero percent change! }
$$

This is because $D^{2}$ cancels in the product $P=Q \Delta p=8 \pi \mu L V^{2}$. Ans. (d)
NOTE: The flow is still laminar, $\operatorname{Re}_{D}=492$.

C5.4 The Taco Inc. Model 4013 centrifugal pump has an impeller of diameter $\mathrm{D}=12.95 \mathrm{in}$. When pumping $20^{\circ} \mathrm{C}$ water at $\Omega=1160 \mathrm{rev} / \mathrm{min}$, the measured flow rate Q and pressure rise $\Delta \mathrm{p}$ are given by the manufacturer as follows:

| $\mathrm{Q}(\mathrm{gal} / \mathrm{min})$ | $\sim$ | 200 | 300 | 400 | 500 | 600 | 700 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\Delta \mathrm{p}(\mathrm{psi})$ | $\sim$ | 36 | 35 | 34 | 32 | 29 | 23 |

(a) Assuming that $\Delta \mathrm{p}=\mathrm{fcn}(\rho, \mathrm{Q}, \mathrm{D}, \Omega)$, use the Pi theorem to rewrite this function in terms of dimensionless parameters and then plot the given data in dimensionless form. (b) It is desired to use the same pump, running at $900 \mathrm{rev} / \mathrm{min}$, to pump $20^{\circ} \mathrm{C}$ gasoline at $400 \mathrm{gal} / \mathrm{min}$. According to your dimensionless correlation, what pressure rise $\Delta \mathrm{p}$ is expected, in $\mathrm{lbf} / \mathrm{in}^{2}$ ?

Solution: There are $n=5$ variables and $j=3$ dimensions (M, L, T), hence we expect $n-j=5-3=2 \mathrm{Pi}$ groups. The author selects $(\rho, D, \Omega)$ as repeating variables, whence

$$
\Pi_{1}=\frac{\Delta p}{\rho \Omega^{2} D^{2}} ; \quad \Pi_{2}=\frac{Q}{\Omega D^{3}}, \quad \text { or: } \quad \frac{\Delta \boldsymbol{p}}{\rho \Omega^{2} D^{2}}=f c n\left(\frac{\boldsymbol{Q}}{\Omega D^{3}}\right) \quad \text { Ans. (a) }
$$

Convert the data to this form, using $\Omega=19.33 \mathrm{rev} / \mathrm{s}, \mathrm{D}=1.079 \mathrm{ft}, \rho=1.94 \mathrm{slug} / \mathrm{ft}^{3}$, and use $\Delta \mathrm{p}$ in $\mathrm{lbf} / \mathrm{ft}^{2}$, not psi , and Q in $\mathrm{ft}^{3} / \mathrm{s}$, not $\mathrm{gal} / \mathrm{min}$ :

| $\mathrm{Q}(\mathrm{gal} / \mathrm{min})$ | $\sim$ | 200 | 300 | 400 | 500 | 600 | 700 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\Delta \mathrm{p} /\left(\rho \Omega^{2} \mathrm{D}^{2}\right):$ |  | 6.14 | 5.97 | 5.80 | 5.46 | 4.95 | 3.92 |
| $\mathrm{Q} /\left(\Omega \mathrm{D}^{3}\right):$ |  | 0.0183 | 0.0275 | 0.0367 | 0.0458 | 0.0550 | 0.0642 |

The dimensionless plot of $\Pi 1$ versus $\Pi 2$ is shown below.

(b) The dimensionless chart above is valid for the new conditions, also. Convert $400 \mathrm{gal} / \mathrm{min}$ to $0.891 \mathrm{ft}^{3} / \mathrm{s}$ and $\Omega=900 \mathrm{rev} / \mathrm{min}$ to $15 \mathrm{rev} / \mathrm{s}$. Then evaluate $\Pi 2$ :

$$
\Pi_{2}=\frac{Q}{\Omega D^{3}}=\frac{0.891}{15(1.079)^{3}}=\mathbf{0 . 0 4 7 3}
$$

This value is entered in the chart above, from which we see that the corresponding value of $\Pi 1$ is about 5.4. For gasoline (Table $\mathrm{A}-3$ ), $\rho=1.32 \mathrm{slug} / \mathrm{ft}^{3}$. Then this new running condition with gasoline corresponds to

$$
\Pi_{2}=5.4=\frac{\Delta p}{\rho \Omega^{2} D^{2}}=\frac{\Delta p}{1.32(15)^{2}(1.079)^{2}} \text {, solve for } \Delta p=1870 \frac{l b f}{f t^{2}}=\mathbf{1 3} \frac{\mathbf{l b f}}{\mathbf{i n}^{2}} \quad \text { Ans. (b) }
$$
